### Index

### VOLUME XXXIX

SEPTEMBER, 1917-APRIL, 1918

The material in this index is arranged under authors and subjects and in a few cases under titles, except poems and book reviews, which are listed only under those beadings. Anonymous articles and paragraphs are entered under their subjects. The precise wording of titles has not been retained where abbreviation or paraphrase has seemed more desirable.

Abott Edito, 226.  Activents, erg. 243. Industrial, 371. Acterman, F. L., 392. Acterman, F. L., 392. Acterman, F. L., 392. Adier, I. M., Causes of crime, £41. Admiral, Md., 80. Adrect Ling. Reduce Your Cost of Living!

THE increasingly high cost of living can be reduced at once only by the application of Domestic Science, which shows how to lessen the food bills, how to save time and labor, how to keep the family in health, how to manage all the details of housekeeping in the best and easiest way. Domestic Science makes the work of the housekeeper an interesting profession instead of deadening

an interesting drudgery.

The correspondence courses of the American School of Home Economics were prepared by leading suchess especially for home study. They have been teachers, especially for home study. They have been tested and proved by over 25,000 housekeepers. teachers, institution managers, etc.

The attractive illustrated 100-pags handbook of the school, "The Profession of Home-Making," will be sent on request. Address a pottard or nots—A. S. H. E., 519 West 69th Street, Chicago, Ill.

# Essential to Health and Comfort

Mattress Protectors are necessary for cleanliness of the Mattress.

No good housekeeper considers her bed rightly equipped without Mattress Protectors.

A sheet in itself cannot properly protect the Mattress.

During sleeping hours the body in complete repose throws off waste tissues and gases, much of which penetrate the sheet and are absorbed by the Mattress if not properly protected.

Our Quilted Mattress Protectors are made from pure white wadding incased in bleached white muslin easily washed whenever necessary.

Dry out light and fluffy as

They protect your Mattress from all impurities and lengthen its life.

A single trial will convince.

Insist on seeing our trace mark and name-Excelsior Quilted Mattress Protector-on each Protector.

ne genuine wi Trade Mark "

### THE NEW MALTHUSIANISM

Only a few calamity-howlers have believed in even the possibility of a shortage of food for the modern world. Then, almost at a stroke, war made the possibility a fact. Old Mathus again became a prophet-but with a brand-new modern twist, interpreted for an early issue of the SURVEY by a modern economist.

#### ON GROWING OLDER

With the beginning of Volume 39 this week, the SURVEY may fairly claim to be grown up. It brings an experienced point of view to bear on events. And it does this, we verily believe, without loss of the vision or the high enthusiasms of youth or of youth's warm welcome to the new and the experimental.

In this new volume we shall go on, as in the past, finding our material for discussion in the social work and social thought of the whole country, with frequent trips abroad in the stimulating company of the army sanitarians, the Red Cross agents and the growing body of social workers in Paris-a score of them already-who are laying the foundations on which to rebuild the social and economic life of the stricken peoples of northern France and Belgium; later, of Poland and other near-eastern parts.

# The Training Camp Commissions

By Joseph Lee

PRESIDENT PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA

REDERICK LAW OLMSTED gave as his opinion, formed through his long and effective service with the sanitary commission during the Civil War, that the two things that did most to keep the soldiers well were music and letters from home. Letters from home, or at least letters to home, are among the things for which the training-camp commissions are making special provision. principally through the Young Men's Christian Association: and singing, both by the soldiers and by the people of the neighboring communities, has also been promoted, with results indicated by the following letters from two of the field secretaries of the Playground and Recreation Association of America, which has charge of the community work. Indeed, the maintaining of home relations, and of the other loyalties in which our life so largely consists, may be said to be the leading purpose of both commissions. MY DEAR CHIEF:

Enclosed find songs for Syracuse Mobilization Camp.

Enclosed find songs for Syracuse Mobilization Camp, Between five and six thousand eager men participated with the Community Chorus in the most impriring evening I have ever the Community Chorus in the most impriring evening I have ever the Community Chorus in the Most Community Chorus I have been supported by the Community Chorus I have been considered and the Community Chorus I have seen the access glowing under the lights. The camp became inspired. The most cheered and cheered. Then the southern boys called for Catry many and perfect Day and My Hero. Then they called for Old Block Joe. In the chorus of Old Black Joe—"I'm coming, I'm coming, for yhead is been fine Joe I'm been fine from the Joe In the chorus of Old Black Joe—"I'm coming, I'm coming, I conclusion automobiles way out on the road tooted their horns and it was ten minutes before the enthusiasm subsided. We sang from 8:00 o'clock until 10:00 and ended with the Star Spangled Banner. I have never heard this song SUNG before. The commanding officer came forward after the singing and said it was the greatest thing he had ever listened to. He emphasized to the members of the chorus their opportunity for service to the men and how at no distant day when the watchfires are burning in France and the men sur-rounded by strange tongues, these home songs will he the officers' stand-by; how they will help to put life and energy in the tired hearts and muscles.

A campaign is being waged to enlarge the chorus and to include many more singing societies. Barnhart was cheered to the echo. The men unanimously voted that they wanted the chorus every This morning several commissioned officers phoned to the hotel telling me how much they appreciated this activity. Always sincerely,

SPENCER R. GORDON.

SYRACUSE HOSPITALITY COMMITTEE Office Public Library

DEAR MR. BRAUCHER:

I hasten to tell you of the most inspiring sight I have ever wit-nessed and the greatest occasion of its kind ever staged in America. This afternoon fully twelve thousand people assembled at the stadium of Drake University for a community sing, headed by three military bands and led by Dean Holmes Cowper of Drake University. After singing America and the Battle Hymn of the Republic a military quartette from the Negro officers' reserve training camp military quartette from the Negro others' reserve training camp asing I Want to Be Ready, and Couldn't Hear Nobody Pray. Imme-diately afterward twelve hundred Negro soldiers marched into the studium under command of Col. Ballou, U. S. A. The applause was deafening and after a demonstration of marching and manual of arms three hundred men setspeed to the center of the field. Soon arms inter additing the stepped to the center of the need. Soon the melody of Swing Low, Sweet Chariot was holding the vast audience entranced. The deep, rich and high-pitched voices carried to all parts of the stadium. Shouting All Over God's Heaven was even more wonderful in effect, while Tipperary quite carried the

audience away. audience away.

The externony of raising and lowering the flag was wonderful as the twelve thousand people arose and sang The Star Spangled Banner. The program lasted for an hour and a half and from the appreciation expressed Des Moines will be glad for the repetition of such events. Colonel Roosevelt, who had been invited to be present, found it impossible to come.

The Negroes regard the event of this training camp as the greatest in the life of the race since the Emancipation Proclamation, and as such the people of Des Moines were glad to give recognition. This occasion has had the desired effect of an increased regard for the ability of the Negro soldier and an appreciation of his service to the

I suggested the community sing and secured the consent of the military authorities while a local organization known as The White Sparrows led by Dean Cowper, carried out the program. We have arranged for more of these in September.

Sincerely,

P A PATIN

Des Moines, Iowa.

country.

This chorus work is done by men selected from among our great national song leaders sent by the secretary of war's commission to the various camps. Not all the camps have yet been covered, but the number of leaders is being increased, They will soon, we hope, include Rodeheaver, whose services -between drives against an older and, some people say, a less scrupulous enemy than Germany-have been offered by Billy Sunday.

The value of the singing has been recognized by many of the camp commanders and its effects are already beginning to justify Olmsted's opinion,

Besides stimulating chorus singing the commissions are getting up organ recitals, hand concerts, singing by glee clubs and other forms of musical entertainment, both by the soldiers

and by others for their benefit. But music is only one of very many things that they are doing. Their membership, by the way, is as follows: Secretary of War's Commission on Training Camp Activities: Raymond B. Fosdick, chairman; Lee F. Hammer, Thomas J. Howells, Joseph Lee, Malcolm L. McBride, John R. Mott, Charles P. Neill, Major P. E. Pierce and Joseph E. Raycroft. In addition to these members, two men who are practically members, and who between them are doing about half the commission's work, are John S. Tichenor, in charge of the V. M. C. A. activities, and H. S. Braucher, secretary of the Playground and Recreation Association of America, who directs the work in the communities outside the camps. Clarence A. Perry, of the Russell Sage Foundation, is another by whom some of the commission's most important results have been accomplished.

The Secretary of the Navy's Commission on Training Camp Activities consists of: Raymond B. Fosdičk, chairman: Lieut. Richard E. Byrd, U. S. N., secretary; Clifford W. Barnes, Walter Camp, Selah Chamberlain, John J. Eagan, Joseph Lee, E. T. Meredith, Barton Myers, Charles P. Neill, Mrs. ter, and both commissions are determined to do their part in seeing this determination carried out.

But the negative side of the commissions' work is not the biggest nor the most important. These young men in our training camps are making every sacrifice. They have left their homes, their careers, love and ambition, given up all that had hitherto made life worth living, and it is up to us, the stay-at-homes, to do our little part, to render their sacrifice effective. It is not quite enough that we should barely avoid the wholesale propagation among them of physical disease and moral deterioration with penalties to be collected from the wives and children of such of them as may survive. America asks something more than that. The establishment of these training camps represents a great educational enterprise. These are our national universities for war purposes, schools to which the flower of American youth is being sent. It is our business to see that these men are turned out stronger in every sense-more fit morally, mentally and physically, than they have ever been in their lives. Unless that is accomplished it will have to be said of America, as of every other nation

Fork city, in singing

"JUST A SONG AT TWILIGHT— Harry Barnhart, leader of the great New York Community Chorus, leading the guardsmen at Van Cortlandt Park, New

Helen Ring Robinson, Mrs. Finley J. Shepard, Mrs. Daisy McLaurin Stevens and John S. Tichenor.

The war commission held its first meeting on April 26, the navy commission on July 26.

The work of these commissions is divided mainly into three parts. One part is of a negative sort, namely, to help the President and the secretaries of war and of the navy to exclude vice and drink from the neighborhood of each camp and training station. This work is in charge of Mr. Fosdick, the chairman of both commissions. It has already resulted in intimations from the secretary of war to the local authorities in the neighborhood of several of the training camps that if they did not clean up the camps would be removed—with prompt and salutary results. The matter is always put up in the first instance to the local authorities, but if the symptoms presented by these do not seem to yield to treatment, the secretary of war has power under a recent statute to do whatever may seem to him necessary to effect the desired results so far as prostitution is concerned.

The authorities at Washington mean business in this mat-

that has encountered the problem of the training camp, that we also have failed in its solution.

A large piece of the commissions' educational work, comprising most of that within each camp, is carried on by the Y. M. C. A. This great organization has been asked to render within each camp and training station those services which it has performed so successfully in many lands: on the Mexican border, in the military and prison camps of Europe and of Asia Minor and elsewhere. One of their famous huts or recreation buildings is being provided for each brigade and for every smaller military or naval station. Each of these contains a small library, ample provision for writing letters, and a large auditorium in which, besides religious services by representatives of all denominations, there is carried out a weekly program of lectures, church services, singing, games, moving pictures and other recreational and educational activities. There are five men in charge of each building, one of whom is assigned especially to the development of games and athletics, and near every but you will see basket-ball goals and a volley ball net, and usually a place for pitching quoits, indicating a fraction of the work of this sort that the association is carrying on.

The war commission is also doing some other things inside the camps. It is going to build in each of the larger ones a theater which will seat about 3,000, in which the leading theatrical men of the country have been interested and in which it is being arranged that they will put on some of their best plays.

The American Library Association will at the request of the commission put in each of these camps a central library with a librarian and with branches in the Y, M, C, A, buildings,

A very important piece of work, especially in its bearing on the future, is a plan for the development of the post exchange, which is already being carried out. The post exchange is the most interesting social institution of the army. It consists primarily of a cooperative store for each regiment, run by the men themselves, at which all kinds of small conveniences chocolate, soft drinks, postal cards, base-balls—are sold, the profits going to the regiment, to be distributed or to be used in further development as the men think best. is to develop athletics even beyond what the Y. M. C. A. is able to do in connection with its buildings. Dr. Raycroft has charge of this work and has got some of the leading college athletes of the type that can get everybody doing things into some of the officers' training camps. These men are soon to be made civilian aids to the commanding officer in charge of athletics. The ultimate development which Dr. Raycroft has in mind and which I think will come, is that every company shall have an officer in charge of games and athletics—presumably a lieutenant—and a standardized box in its supply tent containing volley-ball, basket-ball and baseball outfits, a set of quoits and perhaps a few other articles of virtu. When the first set gives out, the post exchange can supply the men with the means for its replacement.

In this connection it is a matter of national congratulation that Walter Camp has been appointed on the Navy Training Camp Commission and that he is already busy on a handgrenade game. Long and unhappy remembrance of Walter Camp leads me and other Harvard men to believe that he will be able to develop his game in a way to show interesting

-WHEN THE LIGHTS ARE LOW"

Messtime, in the fading light from the sun setting over the Palisades just across the Hudson, is the favorite time for singing popular old songs

Mr. Perry, whose specialty is social centers, and who has had experience at Plattsburg, immediately scented the possibilities in the post exchange, worked out a plan with the aid of expert military advice, and submitted it at a meeting of the commission, which plan the War Department immediately adopted, so that it is now in force. It consists mainly in having the purchasing for all the post exchanges in the country done by the commission itself instead of by each regiment post exchange in some haphazard way; in providing money so that the purchases can be made at once instead of vaiting until the men get their first month's pay; and in having a post exchange officer anopointed in each camp and for each army division.

The expected developments are not all of a business nature. The post exchange officer is to be assigned "such other duties as the commanding officer may determine"—which means that if he is social-minded and the commandant is sympathetic with such idea—as in my experience he always is—there is no limit to what he may accomplish in the development of a wholesome social and recreational life in his particular camp.

Another thing the war commission is doing inside the camps

results. And talking of Yale athletes, the development of the post exchange on its business side is being looked after by Malcolm L. McBride whose career as football player and captain has been to me and others a subject of painful remniscence.

The third principal branch of the commission's work (besides prevention and activities within the camps) consists of the mobilization of the social resources in the neighboring communities so as to be of the greatest possible benefit to the officers and men. This is the least visible but to my mind—though as I am in charge of it, I am not wholly impartial—the most interesting and perhaps the most insportant part of the commissions' work.

What we are trying to do may be briefly described as the fostering and conservation of the men's natural relations to the world outside. The underlying cause of the more flagrant evils which have attended the establishment of soldiers' camps in this country and in Europe, the real disease of which these evils have been the symptoms, has been the result of cutting off the men from those relations to home and friends, to

FOLLOWING THE SONG LEADER

Men of the Reserve Officers Training Camp at Fort Nigura singing as they march. Their schedule has been so full that they have had no other time for it. There's no better toxic for lagging feet toward the end of a long hike. A dram major of the Civil War has testified that with a fife and dram corps playing a singing march he could carry a regiment a mile because the could carry a regiment a mile because the could carry a regiment a mile

church, to employment, to social and business associates of which a normal life principally consists, the results including not merely vice and its consequences but homesickness, depression and a general loss of moral and physical tone.

One thing we are trying to do is to make it easy for the men's friends and families to visit them. We have in the communities near each camp a directory made (if not already existing), and rendered accessible to the men for the information of their families, showing where good lodgings are to be found.

We have asked the Travelers' Aid Association to meet people at the station and help them to find their friends and lodging places. We have asked the Young Women's Christian Association to start "hostesses' houses," that is to say, comfortable rest and reception-rooms where women relatives can wait for the men after they have sent for them, and then can sit with them round a small table and have dinner or afternoon tea.

And speaking of the Young Women's Christian Association
—an important and difficult part of our work has been dealing with the national organizations of various sorts.

The Y. W. C. A. is not only putting up hostesses' houses but it and other organizations are furnishing trained women workers who are organizing the girls of each community into clubs and otherwise helping in girls' work. This constitutes a very important branch of our problem because of the well-known tendency of young women to go crazy in the presence of a uniform—a tendency which has resulted in very much of the evil which has attended in very much of the evil which has attended the establishment of training camps. The girls are being formed into clubs, kept busy over Red Cross work, athletics and social recreation of their own, and helped to give properly chaperoned dances for the soldiers.

There are also being established in the neighborhood of each camp women patrols of an informal and for the most part unnoticeable sort, who by their advice and influence at the right moment can, it is believed, do a great deal to keep girls from going wrong from mere silliness and lack of realization of what they are doing—at least that has been the very definite experience in England.

But the most important and difficult work is in establishing natural social relations between the men in the camps and the local community itself. Here a great variety of things are being done. In the first place a census is made of the men in each camp, usually through the cooperation of the commanding officer, showing their church affiliations, what college and college society if any they belong to, and in what fraternity, Masonic order or other similar organization they hold a membership; also their preference in games, whether they are musical, and what their hobby is. Through this sort of census, churches are able to invite soldiers of their respective denominations to come and take part in their services, sing in their choirs, preach, address their Sunday-school classes or organizations of boy scouts, and otherwise not merely receive religious ministrations but take part as real and active members of their respective churches. In the same way college societies and lodges have given smoke talks, held dances and receptions (which the churches also have done to a notable degree), got up athletic contests and generally made the men of their respective orders and denominations feel at home.

We put special accent on the matter of dances and other ways for the soldiers and salions to meet girls under natural and wholesome conditions. Personally I believe—and such, I think, is the opinion of all the members at least of the army commission—that it is better that the soldiers' camps should be near fair-sized communities, in spite of the dangers, because of the positive advantages of their seeing other people and especially girls in a normal and wholesome way. We seek to promate health, not merely climinate disease.

As to the establishment of intimate social relations between the soldiers and the families in the neighboring communities, it has been demonstrated that these will grow if given a fair chance and not killed by some injudicious forcing process. There has sprung up around the various camps an immense amount of taking soldiers home to dinner, and most of it seems to have resulted in making them really feel at home.

The public resources of the communities near the camps have been thrown open in the fullest and most cordial way. Dozens of ponds and swimming pools and hundreds of shower lattls have been made available for the soldiers. In a number of cases pools have been constructed for their special benefit. Country clubs, golf clubs, tennis clubs and public playgrounds have sent them special invitations.

Libraries are being kept open evenings and Sundays for their use, and it is astonishing how much reading these men will do, the more serious kind of books becoming more popular as the period of their service lengthens. The Y. M. C. A. finds its French classes well patronized, and we outside workers have in many cases found the teachers for them—one of the many examples of good team play.

In many places soldiers' clubs have been started. In one city the Rotary Club has taken over an old clubhouse, tradespeople have provided the various furnishings, and it has been landed over bodily to be carried on by the soldiers' own representatives. In other instances the top floor of some store or office building has been used. In Boston the Y. M. C. A. is giving its two upper stories for the use of the soldiers and sailors as their private club. In some cases special club buildings are being constructed, either adjoining the camp or in the city to which the men naturally gravitate.

The tendency to "go to town" is very strong because of the monotony of camp life. I think that is about the first idea any of us would have under a similar experience. And when the men get to town there is often nothing much to do and no decent place to sleep that they can afford to pay for. That is why soldiers' clubs with lodging features are so important in the cities near training camps; they are intended not so much to attract the soldiers to town as to give them some place to go when they are tired and some place to pass the night. They usually contain provision for pool, billiards, quiet games, sometimes a graphophone or victrola, a lunch counter (where it is especially important that there should be chooselate and other sweets), shower baths—the most valued re-

source of all-and a place for reading, smoking and writing

This work of precipitating the hospitality of the local communities in such a way that it shall tell for the greatest benefit of the men within the camps, has been assigned by the commission to the Playground and Recreation Association of America and through it to its field secretaries and to H. S. Braucher, its chief executive, by whom the work of all these secretaries is directed. When one considers that this work is now going on in the neighborhood of more than sixty camps and that the number will soon be as high as eighty, and that some of these camps are placed near great cities and that others embrace within the orbit affected a great many different communities-the one at Ayer, Mass., with which I am best acquainted, requiring special organization in about twenty such-one gets some notion of the magnitude of the task involved. But it is difficult to give an idea of the intricacy and infinite detail of this kind of work in each community in which it is carried on. It is an impossible sort of thing to visualize. Its highest fruit, perhaps, is found where a young soldier is sitting by the fire in a country home of people until lately strangers to him. The less visible the work has been, the more unconscious he and his hostess are of the machinery that was set in motion to bring the result about, the more successfully has the work been done. The matter is one of the handling of human beings in an intimate and personal way. It is an undertaking not lending itself readily to wholesale methods and that can hardly be talked about without a violation of confidence.

It is due to our field secretaries and to Mr. Braucher, their trainer and leader in all this work, to say that in the handling of this difficult matter they have fairly lived up to the injunction which I was once moved to place upon them: "Go forth and achieve the impossible as heretofore."

One of the most inspiring things about this work in communities around the camps has been the enthusiasm shown by the citizens themselves. The people are fairly falling over each other in their anxiety to do the very best they can for they young men. The opportunity is great and the responsibility commensurate. The first victories of our war can be won right here at home. It is the business of the training camp commissions to furnish the necessary leadership.

# France Adopts Her War Orphans

By Arthur W. Towne

SUPERINTENDENT BROOKLYN SOCIETY FOR THE PREVENTION OF CRUELTY TO CHILDREN

RANCE has recently enacted a law for the adoption of all of its "war orphans" as wards of the nation. It provides in an ingenious and sympathetic manner for their relief, protection, education and moral nutree throughout minority. The term "war orphan" applies to all children whose father or mother or other family support has been killed or has been wholly or partly incapacitated by wounds or illness contracted or aggravated through the war, whether as a military or a civil victim. The children of French colonists, as well as those of foreigners enlisted under the tricolor for the duration of the war, are included.

The legislation rests upon the recognition by the nation of its supreme indebtedness to those who, in risking everything for their country, have cherished the hope that the government would not fail in its moral responsibility of guarantees ing the safety and proper rearing of the children whom they have had to leave behind. The law also looks ahead to the period of future reconstruction. Sorely stricken, the country needs to conserve the rising generation under the most favorable conditions to the end that a new France may be built up.

There has been some speculation in our own country as to how France would solve its great problem of caring for so many bereaved children (estimated at some hundreds of thousands); as to whether it would probably be chiefly through emigration, the establishment of new orphanages, or the use of private foster homes. Unquestionably any scheme for the wholesale transplanting of French children to other lands will be discouraged; an earnest effort will be made to have these French boys and girls grow up and be trained for use-

ful occupations and good citizenship right in their own communities among their own relatives and friends, just as their fathers and mothers would wish to have done. While the law leaves it open to utilize both institutional and placingout methods, the committee reports, the debates and the action taken show a preference in the Senate and the Chamber of Deputies for the natural environment of family homes.

M. Léon Bourgeois, then secretary of state, introduced in the Senate in 1915 a measure embodying most of the salient features lately put into statute. His proposals were shortly followed by an alternative bill along more conservative lines drafted by M. Sarraut, at the time minister of public education. One of the principal points of disagreement and discussion had to do with this question: How far should the state supervise and control the guardianship of war orphans? M. Sarraut favored the internal reform of the traditional judicial guardianship (acknowledged by all to be defective in its operations) and liberal reliance upon the assistance of private child-helping agencies, with a minimum of state interference. M. Bourgeois stood for a more active social program, including a closer follow-up of the children, and for a larger acceptance of the state's legitimate obligations by public administrative authorities. The Bourgeois provisions were favored by the examining committees, and after certain amendmends, chiefly compromises urged by M. Perchot and M. Viviani, the bill was unanimously adopted in the Senate on June 23, 1916, and in the Chamber of Deputies on July 24, 1917. The law was signed three days later and its application is to begin as soon as the necessary elections can be held and rules promulgated.

The law establishes a national council administered by inniety-nine governmental officials, representatives of vocational, philanthropic and other organizations, and private citizens, presided over by the minister of education. The national office exercises a general oversight of the entire undertaking, lays down rules, and passes upon appeals. In each of the eighty-seven territorial departments into which the country is divided, is a departmental board comprising thirty-nine members and under the presidency of the local prefect. The main duties of each departmental office are to direct the execution of the law within its respective department, to accept the guardianship of certain children as indicated below, to distribute funds for the maintenance, training and other needs of the wards of the nation living in the department, and to see that private cooperating agencies perform their tasks properly.

Under each departmental office are as many cantonal sections as there are cantons within the department. The members of each cantonal section are recruited among local citizens who seem qualified to befriend or otherwise assist individual wards. One of their functions is to see that all war orphans within the community are reported as entitled to the benefits of the law.

The membership of all, these bodies—national, departmental, cantonal—includes women. The labors of all, except the regular staff employes in the national and departmental offices, are gratuitous.

The essential steps taken with respect to each child who has been reported by a relative or a member of the cantonal section as eligible to become a war orphan, start with a hearing by a district court. If the facts in the case fall within the definitions prescribed by the law, the court simply decrees that the war orphan is adopted as a ward of the nation. With this pronouncement the duty of the court cands.

Within fifteen days thereafter, upon the request of the child's surviving parent (if there be one) or upon an order of a justice of the peace, a "family council" is convened. This is a highly cherished conference long provided for in the civil code for the purpose of nominating a guardian whenever one is to be appointed, and of making recommendations concerning the safeguarding and advancement of the child's interests. It is ordinarily made up of the child's close relatives; but under the new law relating to war orphans, if any of the relatives are incapable or unworthy, the justice of the peace may exclude such persons from the deliberations and may fill any vacancies by calling for delegates from the departmental office or the cantonal section. Whenever possible, the council appoints the surviving parent, some other near relative or a testamentary guardian (previously named by the last deceased parent) as the legal guardian of the new ward of the nation. If such a course is impractical, the duty of making the appointment is referred to the departmental office, which may designate one of its own members or any other suitable man or woman. Thus each war orphan has his or her own individual guardian.

Formerly the power of appointment of women as guardians was very restricted. The present law, by permitting the appointment of women upon an equal footing with men, recognizes in the language of one of the parliamentary reports that guardianship should have its maternal side.

As a means of assuring the proper performance of the duties of guardianship, the family council may also propose, if deemed necessary, the appointment by the departmental office of a so-called guardianship counselor, who is expected to advise with the guardian and to inform the department and office if everything does not go all right. Should the mother or testamentary guardian happen to be the guardian named under the new law, no such counselor may be designated without the guardian's approval. Under other circumstances the departmental office may intervene and appoint a counselor. The guardianship counselors are supposed to be chosen from a list of persons of character and fitness recommended by the cantonal section, and are not, as a rule, attorneys.

In case the guardian at any time becomes negligent or culpable, the departmental office is authorized to call a meeting of the family council for the purpose of considering the situation and making suggestions. Failing to secure the desired results by this means, the departmental office may have court proceedings instituted and request that the child be committed to its custody.

Under the French law, adoption with full parental rights in the sense in which we use the term, has never been encouraged; but the new law provides a way wherehy after a person has had a child for three years adoption is somewhat facilitated.

Money payments for the support, education and other needs of the wards are to be made by the departmental office according to the individual circumstances. While the money is expected to come largely from state and other public funds, the departmental offices as well as the national council are empowered to receive and expend legacies and other private donations. The distribution of grants promises to be much more elastic than would be likely under any ordinary system of pensions. Upon request of the guardian as well as after commitment to it, a departmental office may place any ward in a public or private institution, school, or other child-caring or placing agency, or in a private family. Parental desires as to religious predifections and the means of education are respected.

In working out the machinery and procedure for the guardianship of war orphans extreme care had to be taken not to violate parental rights or arouse the inherent aversion of the French people to anything sunacking of bureaucracy. A study of the law in the light of the time-honored judicial practices in the matter of guardianship discloses that the methods provided for the selection of guardians are based upon a keen appreciation of the wishes of the child's family and friends represented in the traditional family council. Except in cases of commitment of children to a departmental office, and where the family council itself requests the departmental office to name the guardian, the powers of the public administrative authorities are almost wholly inspectorial and supervisory. One cannot help but admire the skill with which this happy combination has been worked out.

The adoption of children as wards of the nation is not without certain precedents. After the war of 1870 and even in isolated instances in the days of the Napoleonic era, the government adopted certain few children. The public relief laws authorize the government to accept the guardianship of child recipients of public relief. There were sentimental grounds for looking with disapproval upon any suggestion that the children of the nation's war heroes should be classed, however, in the same category with dependents. While the so-called assisted children will remain under the jurisdiction of the charitable authorities, the war orphans are spared from any stigma that might possibly attach to them through a similar connection, and, as indicated above, are to be under the ultimate partonage of the educational authorities of the state.

It will be interesting to see as time goes on whether there will be any extension of the excellent system provided for war orphans to other classes of children who may be in need of similar treatment and opportunities. The measure of success to be attained by the proposed plan can be ascertained only through the test of experience. Much depends upon the development of proper social standards and methods, both among those officially charged with the administration of the law and among the various cooperating agencies. It will be no easy task to secure enough workers, paid and volunteer, having the requisite technical knowledge and skill to do this highly delicate type of work efficiently. It will be interesting to observe whether some of the inspectorial duties now devolving upon cantonal volunteers may not ultimately be taken over, at least in part, by professional workers.

One of the greatest difficulties in carrying out the excellent provisions of the law will be the financial one. The measure carries with it no appropriation as yet. Before its adoption, the government had been paying a very small amount for the relief of children suffering from war exigencies; and certain few private enterprises, such as emergency colonies for some of the orphans, have been struggling along as best they can with the limited means at their disposal. To carry out the new governmental program over a number of years on the scale now contemplated will require extensive funds. It is to be hoped that the fiscal resources of the country will permit appropriations which, supplemented by generous private gifts, may insure that this new child welfare undertaking by the nation will prove thoroughly workable and successful.

All in all, the law is a splendid testimonial to the patriotism, the democracy and the future of France.

### Back and Forth to Mexico

By J. B. Gwin

SECRETARY ASSOCIATED CHARITIES EL PASO, TEXAS

HE war has been such a potent factor in its effect on immigration that the new law which provides for a literary test and a head tax of eight dollars has not received the attention which such a radical change in our method for controlling and restricting immigration merits. Even on the Mexican border the war, and more especially the conscription law, have decreased and complicated our figures for new arrivals so that they lose much of their value unless carefully interpreted.

According to general reports supplied by employment agencies, business houses, railroads and immigration officials, the trend of Mexican migration during the past three months has been south instead of north. No records are kept of returning Mexicans at border stations so that the truth as regards their migration homeward can only be guessed at. The exodus has two fundamentally different causes. The cessation of activities on the part of bandits in most of Mexico and the partial restoration of that country to a condition approaching peace but not plenty, has undoubtedly caused hundreds of homesick refugees to quietly gather their few belongings together and turn their faces homeward one by one The Americans hardly know when they leave the border towns but they do know that many well-known Mexican families have disappeared from their midst.

A more recent cause of migration has been the conscription law. In some unknown manner, word was sent out all along the border that Mexican aliens would be conscripted. The Mexican authorities were accused of using this method to induce their citizens to return, but this has been denied. According to immigration officials, there has been a fairly steady stream of returning Mexicans of military age with their families and a corresponding decrease in the new arrivals of similar age. Part of this exodus was due no doubt to the fact that all Mexicans who had declared their intentions of becoming citizens by taking out their "first papers" are subject to draft. From 70 to 75 per cent of these in El Paso, when notified to appear before the examining board, did not appear and have either crossed over into Mexico or are in hiding. Not a single Mexican in the same district who could claim exemption as an alien has failed to do so.

Since the new immigration law went into effect on May, every new arrival at any port in the United States has had to pass the literacy test and pay a head tax of eight dollars if he intended to remain in this country. The officials at the Mexican border ports have made a ruling that every new arrival (children under 16 are excepted if they are with their parents or guardians) must deposit eight dollars, to be refunded if he returns in less than six months. Basing their estimate upon the three months the law has been in effect, the officials at the El Paso station estimate that not less than \$250,000 will be turned into the United States treasury in one year from this port in head-tax money.

The literacy test provides that every entrant must be able to read from twenty to forty lines in any language he cares to be tested in. The lines are always taken from the Bible. The immigration officials are not able to give more than an estimate of the effects of this feature of the new law, but they have not hesitated to say though that from 50 to 75 per cent of all Mexicans applying for admission are debarred because of inability to read. This had debarred, acording to railroad officials, over 50 per cent of the laborarupon whom they depend for their usual summer construction work and they are very much opposed to the law as it stands.

The provisions of the law are enforceable largely because of the new quarantine station located at the international bridge at El Paso. Those who do not come in "legally" but cross the Rio Grande at some fordable point, must have a certificate issued by the officials of the quarantine station before they can be shipped out by the railroads or by the private employment agencies. Consequently they are forced to report at the immigration station before they can secure employment out of the city. There they must pass the literacy test, pay the head tax, be bathed, "de-loused" and passed upon by the physicians.

The effect of the quarantine regulations upon the arrivatingures of the immigration station at El Paso is rather startling. Despite the complaint of the railroads that they are not securing one-half the laborers they have formerly received from Mexico and despite the effects of the literacy test and the higher head tax, which must together debar at least 75 per cent of those seeking to enter, and despite the effect of the conscription law, the officials are quite certain that their report will show more Mexicans admitted at this port during the past three months than for the same months of any other year. While this will be the condition as shown by the immigration statistics the actual facts are that probably the number of Mexican laborers coming north to do "rengancia" work had decreased 75 per cent for this summer.

Organized opposition to the new law has already centered largely upon the literacy test and, according to border newspapers, the railroads and business men of the district will endeavor to have this feature of the law repealed.

### And the Worm Turned

AGENT FOR MOTHERS' AID MAINE STATE BOARD OF CHARITIES AND CORRECTIONS

I. THE COMMUNITY INDICTS THE FEEBLEMINDED

E, the community, object to the feebleminded on the following grounds:

1. They are physically imperfect, mentally

dull and morally vacuous.

2. They are not provident and become dependent in their

- old age.
- It offends us to see such poor wretches in our midst.
   We give them charity, but they never get ahead.
- 5. They require custody to keep them from reproducing their kind.
- 6. They have many children and are not fit to bring them up.
- Their children are repeaters in school, clog up the lower grades, and interfere with the economy and regular progress of the school.
- 8. They cannot understand numbers, do not love reading, do not keep up with current events or know what is going on in the world. They are presented an imple
- on in the world. They are vegetative animals.

  9. Their daughters are "easy marks," and produce illegiti-
- mate children who fill up the orphan asylums.

  10. Their sons are suggestible and fall into crime. They burn our barns, steal our crops, and sometimes commit murder. We are afraid of them. Our jails and prisons are filled with them.
- 11. Their men are likely to assault little girls.
- 12. The feebleminded cannot protect themselves from danger. They get under our automobiles and trains, become en-
- tangled in machinery, and use poor judgment in all crises.

  13. They work well only under direction. Even then they make stupid blunders.
- 14. Their health is not good and they lack resistance to contagious diseases. Through filth and carelessness they spread disease, and cost the community large sums.
- They live in poor houses and tend to create a slum.
   Property in their neighborhood decreases in value.
  - 16. They are promiscuous in domestic relations and trade

- wives. The extra sets of children are placed in orphan asylums at our expense.
- 17. They have low standards of living.
- 18. They hand down their defects from generation to generation and impede the progress of the race.
- 19. The cost of them in orphan asylums, reformatories, jails, prisons, almshouses, and in outdoor relief is a shocking burden to normal taxpayers.
- They are not fit for citizens and should be exterminated.

#### IL. THE FEEBLEMINDED INDICT THE COMMUNITY

 You have investigated us, pried into our homes, inquired into our most private affairs, and we have suffered it.
 Now you call us degenerates and delinquents and say that we are going to ruin the race. We have never ruined it yet.

2. It is true we are poor, for we set no store by wealth. There have been those that embraced poverty with your full commendation, as, for instance, St. Francis of Assisi. But he was one of your own class. When a feebleaminded man gives his whole life to serve others for a pitrance, and has generously given of his strength to plow the fields and harvest the crops of others, will you deny him bread when he can no longer do his daily toil?

 We are naturally happy and sunny in temperament, but your children tease and torment our children and make their lives miserable.

4. We want your friendship more than your charity, but if you must give us charity let it be mental rather than metal.

5. Idiots and imbeciles, we admit, require custody in their own homes or in public institutions, because they are incapable of self-support. But we, the morons, with mentalities from eight years up, can earn our livelihood, proxided you give us the right chance. We haven't had it yet, and that is why so many of us have failed. Every feebleminded hobo on the road is one of your failures.

6. The reason that we have many children is because we

do not practice birth control. Let the Creator who implanted the reproductive instinct in the race judge between you and us on race suicide.

- 7. Our greatest grievance against you is in regard to school training. We are trainable, not in books, but with our hands. We can weave, braid, cobble, tinker, and learn every simple kind of work. You give us nothing but abstractions, words, numbers, rules and definitions. Your ten years of school training which you enforce upon us are a shahara to us. We love nature and animals and plants. Like us they are vegetative. In the name of common sense, give us concrete instruction.
- 8. As for knowledge of current topics, we admit that we do not topicy reading the Outlook or the Literary Digast. Rather would we prefer of a spring day to sit under a blosoming tree and whittle a stick when the day's work is done. Neither can our growing boys bear to sit forever in a school room under the compulsory non-education law, when they might be playing hookey and steal away to a tumbling brook to catch a string of speckled beauties. And if, sirs, you had the real red blood in your veins that you talk so much about, you would have your schools out-of-doors, near to nature's heart.
- 9. Our daughters are natural, simple and trusting. When you make false love to them they believe you. It were better if you were worthy of their simple faith. But if you blame them for their innocence let the man of you who is sexually chaste cast the first stone.
- 10. The crimes that are punishable are the ones that we commit. You get away with yours. Suppose there is a sheep at pasture and a feebleminded man kills and east of it because he is hungry. You cry "thief, thief," brand him as a degenerate and give him the limit of the law. But if one of your normal men can make a million off from stocks, you laud his shrewdness. He is not arrested for taking the value of 100,000 sheep which he has not earned.
- 11. Your sons rape our daughters. Is it any worse if an occasional one of us rapes one of yours?
- 12. Your speed-crazed autos take toll of normal as well as feebleminded persons. But the moron is safest on the farm, tilling the soil, plodding along with oxen and domestic fowls.
- 13. We, though stupid, are industrious, good at hand labor, willing to work early and late if you give us a kind word. You can afford to direct our industry, for our toil is surely worth a little more than our simple living costs.
- 14. We are not perfectly well, but neither are you. Our nerves at least are steady and yours are not. We can bear pain well, can endure privation and can stand extremes of heat and cold. In the name of public health and race progress, we indict you because you overvor's, overworry, live at too fast a pace, burn the candle at both ends, overstimulate yourselves with food and drink, shorten your hours of sleep, compete too keenly with others for hollow honors, and have too many terminal breakdowns. If you keep on at the present neutrasthenic rate you will presently need some of our stable blood to mix with your over-excited systems, to keep the race from ending in the mad-houst
- 15. You rent us houses that are not fit to live in. Is it the tenant or the landlord who creates the slum? You have brought it about that more than half of the race lives in big cities. That is hard on us, we confess. You, thoughtful people, have built that great monstrosity, New York city,

- with its burning pavements, treeless streets and congested tenements. Do you really call that a normal, sensible thing to have done? Better for us is the little cabin on the mountain side, amid green trees and grass, with a brook to fish in, and furry animals to trap, field strawberries to pick, apples to shake from the trees, a sack of cornmeal to go to, and a pig to fatten and kill. Man's days are as grass. You say in your "write-ups" that our shanties are unpainted and our window lights gone. That at least lets in the light and air. We have seen in your walls grated holes, rather dusty, to be sure, which you point out proudly as ventilators. To our dazed minds you have chosen ill to pack the poor people into tenements. Better a Hebrew patriarch tending his flocks on the hills of Judea than a dyspeptic bank president of the metropolis, with a private secretary at one elbow to rush him from one engagement to another, and a doctor at the other elbow to keep him from going insane.
- 16. We know the divorce court is the correct and proper way of trading wives, but we cannot affird it. So we bind the bargain with a pouch of tobacco. When in domestic difficulties, it is easy for you to send your children to finish at hoarding schools. Those are your orphan asylums. We are not better than you, but are we worse?
- 17. We admit that our standards of living are different from yours and confess our inability to understand all of yours. You keep dogs, cats, parrots and alligators in your houses, but not hens. You bare your necks, we bare our feet. You eat asparagus tips with your fingers and we eat pie with ours. You accuse us of keeping our table set all the time, but if we recollect, the thanes of merry England kept a bountful roast of beef always on the sideboard. You polish your nails and we polish our noses. It would require your wisdom, which we lack, to explain these differences.
- 18. You profess to be atraid of the feebleminded stock for fear it will propagate faster than yours and ultimately get to be in the majority. If, in the survival of the fittest, this ever happens, we will courteously exchange places with you, and set apart for your use the custodial asylums, to conserve your feeble strain.
- 19. You want to cut us off body and soul, so that the race will have no bottom layer. Forsooth, you remind us of the feebleminded man—or was he Irish? (our memory is poor) who thought that rear-end railroad collisions can be prevented by detaching the rear-coach from each train.
- 20. We are not predisposed to crime and lust and alcoholic excess any more than you, but we are easily influenced. Take the saloon away from us, purify our environment, teach us to do the work that we are fitted to do, protect us as you protect children, house us as well as you house your stock, pay us in kind for our labor, be thankful that we are not noisy agitators like the socialists or peevish and unhappy like your own neurasthenics. We represent in a way the childhood of the race, the dawn of human history, the making of a man, and why is that a more despicable job in the twornteth century than in the beginning? And remember, last of all, that WE ARE YOUR COMMON LABORERS. If you lacked us you would miss us. As one of your own poets has said.

No man is born into the world whose work is not born with him. There is always work And tools to work withal, for those who wil, And blessed are the horny hands of toil.

# Some Myths in School Keeping

By Albert J. Levine

NE hears a lot of the "average citizen," "average reader" and "average boy." Science is discounting the dependability of this term as a measure; but popular usage has endowed it with a meaning that is more than approximative. The vogue it is enjoying is contributing not inconsiderably to the looseness of the language of achievement.

A statistical average is understandable. The component units are known, they are calculable. But the computation of an "average" based upon the incalculable psychological factors entering into feeling, knowing and willing is a dangerous practice that is involving educators in grave misconcentions.

The "average child" is a figurative expression helpful in conveying an idea of unity in the midst of diversity; but is a concept decidedly individual in its formation.

The chief objection to the use of "average" lies in the scientific application of an unscientific term. Courses of study are constructed for the "average pupil." The probable error for a small community is perhaps negligible. The special class and the speed class usually rectify deviations. The town school may suffer little from maladjustment of the curriculum to its homogeneous school population. It is the city, with its welter of nationalities, that suffers most from the ineptness of the curriculum. With its birdshot ammunition it manages to make some "hits;" when one hunts the "average" on meed not be a marksman—the scatter-shot saves one from a total "miss."

Writers of school books exhibit this lack of approchment between curriculum and the individual pupil. They could their contents in the language of their "average pupil." The result is that the books are written at pupils. They address the pupils du haut en has. They bear the carmarks of having been constructed for a highly gifted "average pupil" personally known, berhans, to the author.

Charles Kaye, writing in Printers' Ink, makes a similar characterization in the field of catalog writing. He instances one literary effort, addressed to hardware merchants of small towns, abounding in the finely chiseled phrases: 'the diversified occupations,' "potential prospects' and "per capita basis." Its quotation of prices saves such a catalog from sheer pedantry. There is justification for the judgment "that the small town merchant couldn't tell a diversified occupation from a hypotenuse of a triangle . . . while per capita has a gruesome suggestion."

To an adult of limited education such phraseology is dismaying; to immature minds it is positively stupefying. Yet a popular history of the United States delivers itself of this effusion: "It was Thomas Jefferson, president of the United States from 1801 to 1809, whose sound democratic instincts and robust political philosophy prevented the Federal Government from becoming too closely allied with the interests of particular classes." This is not an invidious choice. It is a sentence taken from the body of a dissertation on Jefferson constituting a portion of the work for the eighth year of grammar school. The pupils of a certain class who made a study of this topic were "average pupils" of a particular locality. Yet out of a class of forty-five pupils, thirry checked this extract as incomprehensible; they could get no help from the

general drift of the context; they could generate no light from the antecedent statements. When the class reached this passage they ran into a blind alley. Of the individual words constituting the few paragraphs studied for vocabulary the following words evoked faint response: "decisions, robust, philosophical, completeness, profound, instinct, allied, and endure."

No doubt there are children who are familiar with these words, but the "average" class suffers from linguistic limitations peculiar to foreigners.

The fallacy of "average pupils" has its twin in that of "class teaching." It proceeds on the assumption that the wide distribution of the "average" tends to crystallize certain pupils into groups; the grading of these children into classes or grades is an important phase of school keeping; and the chief justification of such classification is manipular convenience. It is easier and cheaper to teach a class than an individual. The teacher abstracts certain mental characteristics from the class groups and adjusts her methods to that abstraction. School officials standardize the methods and the taxpayer helps toward institutionalizing the lock-step form of school organization.

If this diagnosis is correct, if the teaching of the "average" is wasteful, how can we avoid this waste? One school obviates the difficulty by double promotions within the same grade. When the children are promoted, teachers are requested to grade the incoming pupils on their ability to continue their studies in the three R's. Coincidentally with this tentative promotion the principal sends his teachers a number of textbooks from which they are asked to choose those that are best adapted for the degree of proficiency displayed by those of the pupils who have shown a decided weakness in language, reading and arithmetic. The teachers try out books with the least progressive pupils. After the lapse of one month the children are redistributed in classes that devote the major portion of their time to one subject. The final step in the act of promotion finds the pupils of one grade in one of three rooms or classes: an arithmetic class, a language class or a reading class. This affords a close approximation to a workable, teachable, "average" unit.

Classes are equipped with the books suitable to the mentality of their members. At the expiration of the term the classification is changed for the pupils whose improvement warrants their readmission into normal classes pursuing the traditional studies on standard time allotment. This form of school organization may be characterized as class-individual instruction.

To the taxpayer, scholars is scholars. The school budget is too often stretched out of joint to fit the procrustean bed of school attendance. Despite the strident cry for a business administration of schools, school keeping remains, for the most part, untouched by the business philosophy of scientific management. It takes money to eliminate waste motion; the efficiency expert is a high-priced employe. But an educational laboratory must be established to save the school board members from stultification. A beginning has already been made in an attempt to determine how far individual instruction may cut down the time consumed in turning out the completed school product, the public school graduate. The Spewer School of Columbia University is studying means of accelerating the

progress of the pupil through the grades, and New York city is conducting experiments in six-year courses aiming at the construction of a new terminal for the educational road.

The results so far obtained by these experiments justify the high hopes of their sponsors. The scholastic idiosyncrasies of the individual are stressing the wastefulness of mass teaching. Mathematical ability is not always a concomitant of linguistic excellence. History may be a stumbling block for one pupil; another may find insuperable difficulties in mastering geography. The intellectual "square peg" is a much of a reality as the industrial one; and there is but one way to find out whether a child is a "square peg" or a "round peg," and that is by individual testing-out in an educational laboratory under supervision of trained observers conversant with educational scales and tests of proven merit.

But one must not rest with mere correct labeling of a child; administrative machinery must be created to give that child individual instruction. Methods must be devised to teach children through their preferred senses. With some the are is more efficacious than the eye. The motor-minded must be given opportunity to use their hands. The eye-minded make little progress through oral instruction. Picturization of the curriculum is just as feasible, within limits, as its motorization.

To effect these innovations the school budget committees must extend liberal financial aid. The attitude of the public is typified by the hard-fisted husband who complains of his wife's perennial demand for money. "What does she do with the money?" "I don't know," the aggrieved husband answered, "I haven't given her any."

The case for individual instruction has been ably stated by Frederick Burk, president of the San Francisco State Normal School, who claims that "individual instruction saves from one to three years in the time needed for an elementary education, eliminates many wastes of present methods, and provides a much better training for 'every child'," and "would conserve considerably over 50 per cent of the present school expenditure." [See the Sunvey for February 26, 1916, page 634.] It will do all this—ultimately. But the expense mounts rapidly during the period of unavoidable transition.

A not inconsiderable increase must follow the scrapping of useless material, the remodeling of classrooms, the temporary increase in the number of teachers, the training a corp's of teachers in the technique of individual instruction—a technique that involves the multiplication of pedagogic devices and the readjustment of pedagogic "laws"—the creation of supervisory instrumentalities to inaugurate the new system, and the institution of a campaign against the obstructive forces of conservatism. The public must cooperate. Reorganization of any human agency—reassociating its units and unifying its new aims—entails heavy initial expense; and the total expense can be estimated only after actual rehabilitation.

If school keeping is to yield good results it must be purged of many misconceptions. We have yet to lay the ghosts of the gorgeous myths of "average child" and "class teaching." We are just waking up to the hopelessness of cutting our celucational material to clothen mythical beings whose measurements are a source of conjecture. We still pretend to find mental homogeneity in a class membership of a heterogeneous city population. We yield too much to the exigencies of economy; and the demands of mass teaching give little scope for personal contact. We must stop teaching the "average child;" the genius and the laggard cannot learn willy-nilly. We must formulate a curriculum for these "trues" of children.

It has been decreed that the child must wear the educational harness for eight years; the dullard and the genius must serve the same time. Plans to test the validity of this practice have only reached the "conversational stage," because we are still without sufficient experimental data on which to base a reconstruction of the school curriculum. This momentous problem can only be settled in the educational experimental stations.

Reports are reaching us of successful school organization based on a six-year course. Acceleration of the preparatory stops are becoming increasingly urgent in view of the growing obliteration of the line of demarcation between youth and manhood, between school and life. The boy must be prepared to don the toga virilis before his appointed time because of the compulsion of economic want; the school must help him burst his chrysalis.

### THE RED CROSS BANNER

By Laura G. Woodberry .

PATTERN of Healing, soft, Woven of Light. Radiant Charity, Dear in men's sight. Emblem of Sacrifice, Be thou our care! Thine is the burden that each one may share. Help ease the pillow of pain and despair!

Help ease the pillow of pain and despair!
Sign of Devotion,
Magnificent, rare,
Making the Hell of
War lighter to bear.
Hail blessed Beacon!
Beloved everywhere!
Shedding sweet Hope on the war-blackened air.
Liberts needs the Red Gross! Do your share!

VIEW OF THE COLORADO FUEL AND IRON COMPANY CAMP AT IDEAL, COLO,

# Two Years of the Rockefeller Plan

By John A. Fitch

OF THE SURVEY STAFF

HIS is the story of a changed order. Who changed it doesn't matter, though no list would be complete that didn't include Mother Jones and John D. Rockefeller, Jr., the United Mine Workers and the Industrial Relations Commission. What does matter is that the bitterness engendered by the Colorado strike of 1913-1914 and the events back of it is being slowly but surely wiped out and that a better state of affairs, industrial and political, is coming into being in Colorado.

Three years ago the president of the Victor-American Fuel Company, the next to the largest coal company in Colorado, smote the table before him and swore that he would fasten the strands of autocratic industrial government tighter than

Three years ago the president of the Colorado Fuel and Iron Company, the largest coal company in Colorado, testified that his company maintained what were known as "closed" camps. Into these camps the public had no definite right of entry, although in some of them as many as 600 people were living.

Three years ago the general manager of the coal-mining properties of the Colorado Fuel and Iron Company declared that it was his practice to prevent anyone from entering these communities, even for social purposes, if he disapproved of them in any way. He testified in court that the company would not permit men to come into the camps "to discuss with the employes certain principles, or to carry on arguments with them or to appeal to their reason, or to discuss with them things along reasonable lines," alleging that such discussion would lead to violence.

Three years ago the leading coal operators of Colorado were refusing to meet any representatives of the coal miners' union, for any purpose. When they could avoid it they would not even sit in the same roon with them.

All that is over. Before me, as I write, there is a little

green book. On the cover is the inscription, "Agreement, by and between the Victor-American Fuel Company and the United Mine Workers of America, District No. 15, for period beginning March 26, 1917, and ending March 31, 1920." Actually three years after the strike of 1913-14 we find the company that had the reputation of being the bitterest enemy of unionism in Colorado, signing a union agreement to run for the next three years!

In 1914, Victor-American and Colorado Fuel and Iron were following the same policies. During the whole of the long strike no union leader crossed the threshold of either company. A few weeks ago I was sitting in the office of the Colorado Fuel and Iron Company in Denver, waiting to see Pres. J. F. Welborn, who was engaged with callers. As I sat there the door of the private office swung out and two men emerged. I glanced up, and then looked hard, Yes, I was right! The men were James F. Moran, acting president of District No. 15, United Mine Workers of America, and John McLennan, president of the State Federation of Labor, They had been having a conference with President Welborn to discuss matters affecting the employes of the Colorado Fuel and Iron Company. Their presence was no indication that the company has recognized the union, but it did indicate a long stride from the position taken by the company only three years

I knew that a change had taken place, for I had just come from a visit to the coal camps in the southern part of the state. I had gone freely into open and closed camps alike, talked with whom I pleased and no one interfered and no one asked my business. Three years ago casual strangers were run out with scant ceremony. I asked a miner what my reception would have been if I had come in the same way, without credentials, during the old régime. "They'd have had you by the nape of the neck in fifteen minutes," he replied. This miner, morcover, knew whereof he spoke. He had once

been given three hours to pack his household goods and with his family get out of camp. He had been suspected, without foundation, of being a union man.

I saw only one camp marshal in this trip. He was wearing a deputy-sheriff's star. He told me that he was the only camp marshal in the Colorado Fuel and Iron Company camps in that county who had a deputy's commission. The sheriff wouldn't issue commissions to the others, he said. And this was on the old stamping-ground of Sheriff J. S. Grisham, who picked grand juries, bullied strikers and issued commissions to mine guards wholesale!

I was in Trinidad once, some years ago, when there was only one man in all the region round about who dared let it be known that he was a member of the United Mine Workers. He lived in Trinidad and didn't work in the mines. On that trip, incidentally, a muscular-looking gentleman whom I did not know showed a decided interest in my movements, ate his meals at the hotel where I stayed, and at the same time; courteously waiting for me in the lobby at breakfast-time that I might precede him into the dining-room.

This time I had no chaperon. The secretary of a local miners' union from one of the camps nearby, himself a working miner, stood openly on the street corner and talked with me of union affairs. We even got into a street car together and rode out to the camp.

I learned that there are union locals in every one of the Colorado Fuel and Iron Company camps. The union claims 90 per cent of all the employes in the camps. The company denies the claim, but admits that 50 per cent belong to the union. In every camp union meetings are held openly. Before the strike, three years ago, meetings had to be held in secret, sometimes at a distance from camp, under cover of darkness.

These are some of the industrial changes that have come about in Colorado in three years' time. There have been political changes that reflect no less a new order and a changed spirit. The state administration that was elected in a campaign of hate has given way to officials of a different temperament. At the request of the present autorney-general the case against John Lawson has been quashed. The supreme court has ordered a new trial for Zancanelli, a striker who was indicted and tried in the heat of passion and sentenced to life imprisonment. Hundreds of indictments still pending against the striking miners of three years ago have been dismissed.

Nothing more strikingly illustrates the change than the defeat of Sheriff Grisham in Las Animas county and Sheriff Farr in Huerfano county, the two big coal companies of southern Colorado. These two men had faithfully served the coal companies and viciously fought the miners whenever a controversy between the two arose. Grisham personally named the grand jury that indicted John Lawson and admitted that at least half of the men he selected were friendly or under obligations to the coal company.

Farr was known as the "king of Huerfano county," where he had been sheriff for twenty years. His first setback came after the 1914 election. It was a hot campaign, but Farr was declared elected. His opponent appealed to the courts. The supreme court of Colorado, in an opinion that relentlessly excoriated the political methods by which Farr's supremacy had been built up, threw out the returns from several precincts where, by the worst tactics of in-imidation, a free election had been made impossible, and declared Neelley, the contestant, entitled to the office. In the 1916 election Neelley was again elected, this time by an unquestioned majority.

Then there is Judge Granby Hillyer, who was appointed

by the governor to try the cases growing out of the strike. It was Judge Hillyer who sentenced both Lawson and Zancanelli to life imprisonment, before he was barred by the supreme court from sitting in further strike cases, on account of prejudice. In the Zancanelli case Judge Hillyer's rulings were so biased and so prejudicial to the interests of the defense that the supreme court, in ordering a new trial, could not restrain itself from expressing amazement. The errors in these rulings were, according to the court, "so numerous, so obvious, and so fatal to the validity of the proceedings that unless they were written into the record as they are, under the seal of the trial court, we could not believe that such things had occurred in the trial of a cause in a court of record."

Judge Hillyer, too, has been relegated to private life, as the result of a regular election in the judicial district where he exercised temporary authority through the favor of a governor.

For such changes as these to occur in the space of three years seems little short of amazing. But they are wholly explicable. Colorado was ripe for change. The strike itself indicated that. After so prolonged and so determined a contest it was impossible that there should be a return to the status quo ante.

The strike, without doubt, had a profound influence on the people of southern Colorado. It aroused them to a new sort of thinking. They saw their elected officials violating their obligations to the people. What they did not see they heard and read about in the testimony before the congressional committee that investigated the strike, in the hearings of the Industrial Relations Commission, and above all in the scathing words of the supreme court of the state in the decision depriving Jeff Farr of the office of sheriff of Huerfano county. In describing the condition that existed in certain "closed" camps on election day, 1914, the court said:

There can be no free, open, and fair election as contemplated by the Constitution where private industrial corporations so throttle public epinion, deny the free exercise of choice by sovereign electors, dictate and courted all election officers, problish public discussion of public questions, and imperially command what citizens may and what citizens may not peacefully and for lawful purposes, enter upon election or public territory. (Neeley vs. Farr, Colorado Reports, 1916.)

It is reasonable to believe, also, that the same publicity which opened the eyes of the people to the political abuses for which the coal companies were responsible had a profound influence in the correcting of many abuses by the company.

Another factor, too, has wrought this change—the war. As business picked up after the temporary depression of 1914 there was and still is, as everyone knows, a great demand for

THE BERWIND-TABASCO Y. M. C. A. BUILDING-UNDER CON-

coal and a shortage of men. It has been a time for the extension of union influence all over the country, and Colorado has been no exception. In Colorado the explanation given for the capitulation of the arch enemy of the union, the Victor-American Fuel Company, is the growth of the union in the coal camps, the shortage of labor and the necessity of getting out coal.

All of these factors have doubtless been equally influential with the Colorado Fuel and Iron Company. But though the camps are open, the men free to organize and strangers come and go without interference, the Colorado Fuel and Iron Company so far has refused recognition of the union. Instad it has adopted a policy of actually competing with the unions for the benefit and interest of the men through the establishment of the famous Rockefeller Plan. No description of affairs in Colorado would be complete without some account of this interesting experiment.

#### The Rockefeller Plan

Witex John D. Rockefeller, Jr., visited Colorado in 1915 to outlined a scheme generally understood to have been devised by W. L. Mackenzie King for the adjustment of grievances and for the cooperation of the employes with the company in the improvement of working and living conditions. Officially this is known as the Industrial Representation, but unofficially as the Rockefeller Plan.

It provides for an annual meeting of the employes of each camp and in each department of the steel works at Pueblo, to elect one representative for every one hundred and fifty wage-earners. Soon after these annual elections meetings of all the representatives are held in each of the five mining districts and at the steel works, which are also attended by the president of the company or his representative, and other company officials. Subsequent meetings are held every four months. At the first district meeting, in addition to the discussion of "matters of mutual interest," there are selected four committees for the district, as follows: industrial cooperation and conciliation; safety and accident; sanitation, health and housing, and recreation and education. Each committee has six members, three of whom are chosen by the employes' representative and the other three by the president of the company or his representative,

In December of each year a general meeting is held which is attended by the employes' representatives in all of the districts and by the president and other officers of the company. At this meeting reports are made by the joint committees and "matters of common interest requiring collective perion" are considered.

The employes' representatives in each camp, chosen under the plan, are expected to take up with the superintendent or other camp official all grievances to which their attention is called by other employes. If justice cannot be secured, or a suisfactory adjustment made, the representative may send for the president's "personal representative," who is constantly moving about among the camps for the purpose of promoting harmonious relations. This is David Griffiths, a former state mining inspector and mine superintendent, a genial, conscientious and fait-minded OW delshman, who has had considerable success in restoring amicable relations when they have become strained.

If he fails, however, the employe or his representative may appeal to all the higher officers in turn up to the president, or they may refer the matter to the committee on cooperation and conciliation for final adjustment. If there is a deadlock in the committee the matter may be referred to the state industrial commission for final determination. Similar steps are followed for the adjustment of differences at the steel works.

This plan was proposed to the men at a convention including representatives from each camp in October, 1915. It was adopted, the action later being ratified by a vore of the miners taken in the camps. At the same time an agreement covering wages, hours and working conditions was entered into, to run until January, 1918. The eight-hour day, required by state law, was written into the contract; wages, according to the stipulation, were to remain the same unless wages were raised in competitive districts, when a proportional increase would be granted in the mines of the Colorado Fuel and Iron Company. Under this clause there have been several advances since the agreement was made.

It must be understood, first of all, that the development of the Rockefeller Plan and the growth of the union, side by side, present two mutually incompatible and therefore discordant elements. The union is an organization that owes its origin to the workers themselves. The Rockefeller Plan was devised by the employing interests and proffered without previous consultation or conference to the men. It was accepted by a convention of miners' representatives and company officials which had power to amend it. Nevertheless, the psychological basis for friction in a situation of this kind must be evident.

The union has consequently worked steadily against the plan from the beginning, and has done what it could to make it a failure. While the open, acknowledged presence of the union is in itself evidence of good faith on the part of the company in adhering to that part of the plan that guarantees the right of union membership, the presence of the union, with its organizers, has undoubtedly had a tendency to hamper the successful operation of the plan as a whole.

#### Infrequency of Grievances

IT is a noteworthy fact that the miners do not resort with utmost freedom to the grievance-adjusting machinery. Indeed, I should judge that the tendency is in the direction of less and less interest in the plan. All of the camp representatives with whom I talked told me that very few grievances were brought to their attention-evidence, to some, that there are no grievances. One of them had had only two complaints in three months. The frequency of appeal is in such marked contrast, however, to the customary reactions where there is a democratic plan in which the workers have full confidence, that one is inclined to question the basis for such optimism. At the firm of Hart Schaffner & Marx, for example, there is a board of grievances, created by agreement with a union. The board is in session nearly every day and often for all day, wrestling with all sorts of trade problems. Not all "grievances" are complaints, unless they remain unconsidered and unadjusted.

Under the influence of the union, also, the meetings called by President Welborn for the election of representatives have often had a very slim attendance. In one of the camps where a regular meeting was held, last winter, with coal company officers from Denver present, the union arranged a meeting for the same evening as a sort of counter-demonstration. A bare handful of miners attended the Rockeller Plan meeting while the union meeting, a short distance away, attracted a majority of the men in camp.

At the steel works there is no difficulty about getting a full vote because no meetings are ever held. On the day for electing representatives, the superintendent of each department takes a ballot-box into the mill and every man is expected to drop his ballot in as he goes to work. This insures a 100 per cent vote. It has worked so well, officials of the company tell me, that it is planned to abolish the usual orm of election at the mining camps and take the ballot-box to the mouth of the mine. In that way they would get every man as he went to work.

Among outside observers with whom I talked in Colorado the testimony was almost unanimous that the Rockefeller Plan is being adhered to and its terms are being scrupulously observed. This report came from men who have long been unfriendly to the Colorado Fuel and Iron Company, as well as from those whose words are to be discounted because of personal connection and obligation. But the only people who have personal knowledge of the plan and its workings are, of course, the miners in the camps. I visited a half-dozen camps and talked with the men who live and work there. I met them also in the city of Trinidad, which is in the heart

to me that such a classification was sufficient to account for several of the opinions.

Perhaps I can describe the situation best by telling of three different camp representatives whom I met in succession on the same day. The first was an Italian, I was told, but he spoke such excellent English and his stature was such-he was close to six feet tall-that I could not have guessed his nationality. He was taking a day off on account of a wedding and was wearing his best suit of clothes, in which, with his excellent physique, he made a fine appearance. He was riding about the camp in his own automobile when I met him and invited me to take a ride. The Rockefeller Plan is a great success, he told me. As representative he has very few complaints to handle, and their disposition gives him no trouble whatever. There is no reason why there should be many complaints anyway because conditions are just about right. In reply to my question, he said that a majority of the men in camp belong to the union, and he hears a good deal of talk

COMMITTEE ON SAFETY AND ACCIDENTS. MINNEQUA STEEL WORKS OF THE COLORADO FUEL AND IRON COMPANY

of the coal-mining regions of Las Animas county. Wherever I could I talked with the camp representatives, the men who are elected under the Rockefeller Plan to look after the interests of the company employes.

Most of the camp representatives spoke very highly of the plan—just a shade too enthusiastically, with too little discrimination. This must be a very phenomenon of a plan, I thought, if it works with such absolute smoothness. I have had some experience in talking with workingmen, and I have learned to be somewhat suspicious of men who are absolutely satisfied, because in general I have found but two classes of workmen who say they are, men who want to curry favor with the higher-ups in the hope of special rewards—"company men" their fellows call them—and men who are afraid, for one reason or another, to express their true feelings. I do not mean to imply that all of the camp representatives belong to one or the other of these two classes, but it was clear

about a strike. He is not a member but he attends union meetings occasionally as a "spotter" for the pit boss. I asked him how they happened to let him in. "Well, I'm pretty well known here," he replied, "and they are very anxious to get me as a member, so they treat me pretty well." He had worked for the company seventeen years, he said, and had remained at work through both of the last big strikes, those of 1903-4 and 1913-14.

The next representative I met was clearly Italian. I went up to his house just after the men had come out of the mine and found him preparing to wash from his face the absolutely complete disguise that he had acquired that day in the mine. He gazed at me with a suspicious air that was heightened into an expression almost menacing, due to his coal-dust adornments, as I tried to explain that I wanted to know what it meant to be a camp representative. He could not understand me for a while, but when at last he did innderstand he be-

came volubly excited. Absolutely incomprehensible at first was the torrent of broken English that he flung at me, but finally a few words, constantly recurring, began to stand out: "I not talk about company, I not talk about men, I not talk about men, in I not talk about men, and I not talk about men, I not talk about men, and I not talk men that fear before. I could understand, and told him so. When I had made that clear to him his relief was unmistakable. Suspicion gave way to the most cheerful hospitality and we tried with ill success to talk for a few minutes longer of other matters. As I left he called out, "You see Jim Smith, he talk."

Smith, which was not his name, was another camp representative, who lived not far away. I had intended going to see him, because I had been told that he was a member of the union, and I was especially curious to get criticism from a union member who was also a part of the machinery of the plan. I had met Smith before that day as I went about the camp, but he would not talk to me then. He suggested that I go down to his house later in the afternoon.

When I called, he seemed disinclined to talk freely. He told me briefly that the plan works well. He said, just as did every other camp representative, that the complaints are very few and easy to adjust. He said that conditions in the camp had greatly improved since the adoption of the Rockefeller Plan, mentioning especially the fact that it is now an open instead of a closed camp. But when I asked him about the union he denied being a member, and became increasingly uncommunicative until I left.

#### Attitude of the Union

It was not until I managed to get in touch with some union men in Trinidad that I could get a miner to talk with me freely about affairs under the present régime. I found them, as I expected, very hostile to the Rockfeller Plan. They assured me that there was discrimination against union men and named several union members, including some officers in one of the locals who had been discharged. They felt certain that this was on account of their union activities. They told me that a joint letter had been written by the officers of eight of the locals to President Welborn and a similar one to John D. Rockefeller, Jr., asking for a conference to make a wage scale. Neither had answered the letter and the minonists were apparently quite indignant that their request had been ignored. President Welborn later told me that no such letter had ever reached him.

Another matter that had aroused their resentment concerned the raising of money for the Red Cross. A campaign was carried on last June under the auspices of the company to get the men to give one day's pay. The company agreed to duplicate the sum thus raised, dollar for dollar. The response from the men was fine-nearly 100 per cent. At Sopris, a Colorado Fuel and Iron Company camp, the local union members decided to do better. They voted to donate 1 per cent of their wages regularly to the Red Cross throughout the duration of the war. They asked the company to check off this amount in the office and turn the money over to the secretary of the union to send to the Red Cross. The company refused, pointing out that the request was signed only by the officers of the union, whereas no money could be taken out of any man's pay unless the man himself signed an order authorizing it. They declared further that it is illegal for a man to assign his pay for more than one month at a time and recommended that the men adhere to the plan of one day's pay.

As a result, the union members told me, of accumulated grievances, it was decided to call a strike on the first of last August, if the company did not show a disposition to remedy the situation. The strike threat actually came about in this way: James F. Moran, acting president of District No. 15, United Mine Workers of America, had called a "peace conference," in Denver on June 13, to promote coal production during the war. He invited 150 operators to meet with representatives of the miners in the district "to discuss ways and means of best maintaining industrial peace and promoting mutual confidence between employer and employe while our country is engaged in this great struggle." His letter stated that wage scales would not be discussed. Only twelve operators came to the meeting and none of them represented large properties. President Welborn wrote a letter expressing sympathy with the purposes of the meeting, but stating that they were being accomplished in his company by means of the Rockefeller Plan. Neither he nor any other officer of the Colorado Fuel and Iron Company attended the meeting. The delegates appeared to be very angry over Mr. Welborn's failure to attend, and the next day after the peace conference they met as a union convention and authorized President Moran to call a strike against the Colorado Fuel and Iron Company.

The strike, however, did not occur on August 1 as scheduled, and up to the time of going to press there has been no coal strike in Colorado. The strike talk, nevertheless, gave me some opportunity to test the question of grievances. While the matter was pending I went to Acting President Moran and asked him for a list of the grievances to which he had referred in an open letter to the state industrial commission. giving notice that the strike was to be called August 1. To my great surprise, Mr. Moran had at that time only two grievances on his list, both involving discharges. It later developed that he was mistaken about one of these-the man was still at work. The other man had attended the Denver peace conference, where the strike resolution was adopted, and was discharged on his return to the mine. I was unable to make a personal investigation of this case, so I merely give the union statement and the company reply. The company officials declare that they had not known where the man was-merely that he was absent. He was an inexperienced miner, they said, and when he returned no other miner would work with him. Having thus no "buddy," there was no alternative for him but to quit.

### A State of Mind

INDERD, most of the grievances do not appear to be the most serious in the world. Some of the union officers who were discharged had been guilty, I found, of some grave infractions of the safety rules. Why they of all men, the officers of the union, would set a bad example of that sort I do not know, unless—a perfectly natural thing—they feel rather cocky in their new-found liberty and are inclined to feel that they are immune from the operation of rules.

On the other hand, there is no question but that the company and many of its lesser officials are looking upon the union with anything but friendliness. In one of the camps I had a talk with a mine clerk who dilated on the merits of the Rockefeller Plan. All troubles were settled without difficulty, he said. Of course, there weren't as many grievances brought up now as formerly. At first he union was very active in that direction. They used to send in a lot, but they soon found "the complaints wouldn't be considered." "We let 'em know," he said, "that we were running this business." This attitude is, I believe, contrary to company policy. I cite the incident only to show the feeling that trops out, here and there, because it has an important bearing on the success of the balan.

The refusal of the offer of the union to donate money to the Red Cross on a different basis from that proposed by the company seems to be dictated by a rather grudging spirit. The reasons given seem inadequate. Of course, it is reasonable for the company to ask every man to sign an order before they check off anything from his pay, but there was nothing in the proposal from the union officials to indicate that they were not ready to do that. So far as the difficulty of it is concerned—the necessity of signing an order every month—the company finds no such obstacle when they check off a dollar a month for hospital dues. The authorization, when the man is hired, is sufficient for that. The matter is not of utmost importance, but it seems to me to show a certain hospital cultivative desired the union—a desire not to let it have its way.

The situation is one that justifies the expectation of friction. It would be too much to expect, after all the repression of the years that are gone and after all the bitterness engendered by the strike, that any plan would work without intriction. Here are foremen and company officials who have for many years represented a company that fought every manifestation of democracy. Can it be expected that they will at once give their hearty and generous support to a scheme that allows representatives to speak for the men and permits a union to grow? Here, on the other hand, are men who dare, for the first time in their lives, some of them, openly to belong to a union. Is it not to be expected that they will magnify small grievances and perhaps be somewhat over-sensitive of fancied aggressions?

The real crux of the dissatisfaction, however, seems to be the refusal of the Colorado Fuel and Iron Company to recognize the union. So far as the threatened strike was concerned, the importance of the grievances was a small factor. They served to get a conference with officers of the company and there the demand for recognition was made and refused.

The fact that no strike took place indicates rather clearly that the grievances are not, in themselves, considered a sufficient ground for a strike. But the demand for union recognition will be made again. As the union grows stronger the demand will become more insistent. It can hardly be otherwise, for neither the Rockefeller Plan nor any plan like it can be permanently satisfactory to the men. That is my firm conviction despite the wonderful improvement that has taken place in Colorado in three years' time, and despite the fact that the plane, with its many broad features and its radical break with the past, apparently is being administered in honesty and good faith. No system devised and wholly controlled by the employing interests, as this one is, can either

A PRIZE BACK YARD AT THE WALSEN CAMP

PLAYGROUND AND SCHOOL BUILDING AT IDEAL, COLO.

command the confidence of the worker or be counted on to administer justice.

In the first place, there is no adjudication of disputes under the plan except after a range of appeals that would tax the courage of the most independent worker. The camp representatives, who are elected by the men, have no power whatever in adjusting complaints. They are attorneys, rather, for any miner who wishes to make an appeal to the superintendent. The complainant may appeal, after the superintendent has made his decision, to some higher official, and after that to the committee on cooperation and conciliation, where he may present his case before a board composed of equal numbers of company officials and miners. The latter have no protection, if they vote against the company's views, other than the company itself. They are not independent jurors, immune from reprisal. They would be sure to consider the matter very carefully before taking a stand in opposition to their employers. The union representatives on the grievance board under the Hart, Schaffner & Marx agreement are in a very different position. They are employes of the union. They do not draw their pay from the company whom it may be their duty to oppose, and they are in no danger of discharge if they stand firmly against it.

If the miner with a grievance prefers he may appeal from the decision of the superintendent to the president's industrial representative and he may then appeal, if he wishes, to "the division manager, assistant manager or manager, general manager or the president of the company in consecutive order." Or after the superintendent, some higher official and the committee on conciliation and cooperation have in turn passed on his case he may appeal to the industrial commission of the state. It isn't easy to conceive of the miner who would go hrough all that system of appeals. If he went through it and won, how happy his position would be back on the job in the mine under the whole hierarchy of officials over whose heads he had appealed, from pit boss to general manager! So far only one case has been appealed to the industrial commission.

In addition to the undemocratic origin of the plan, it is, a might be expected, undemocratic in its most essential provisions all the way through. The plan is the company's. Not a single act is done under it, not even the election of representatives in the camps, except under the direction of the president of the company. The only meeting at which company officials are not present are the meetings in each camp for the election of representatives, and they are called by President Welborn. These are the meetings spoken of above, that have never been held at the steel works and are to be done away with at the mines. The company is to place the ballot-boxes where the men can drop in ballots on the way to work.

Over all other meetings, district meetings, annual joint meetings, etc., the plan provides that Mr. Welborn shall preside. There is no opportunity for the men to call their own meetings and take action independently of the company. The pian, it is true, assures to the men in each camp the right to hold such meetings as they desire. This is a wonderful advance over three years ago, but obviously it is not enough. The miners, if they are to deal effectively with their employer, must have opportunity to take council together. They must be free to call meetings, not in one camp alone, but of delegates from two camps, a half-dozen camps, or from all of them whenever they feel that such action is necessary. They must be free to consider their needs together, as employes of the Colorado Fuel and Iron Company, not as neighbors in a single camp, and they must have opportunity to do that in an atmosphere entirely removed from the slightest suspicion of company interference or company dominance.

Under the Rockefeller Plan as it exists at present there is no provision for such meetings. So long as that is true it is certain that the movement to change the plan or supersede it altogether will not abate.

While the grievance adjustment part of the Rockefeller Plan is the most significant feature, other activities carried on by the three principal committees in addition to the committee on conciliation and cooperation, must not be overlooked or under-estimated. Indeed, enormous advance has been made for the welfare of employes since the plan was instituted.

The committees on safety and accidents make suggestions of methods to safeguard life and limb, bringing to a higher efficiency the work that has been carried on so effectively in the mines by the Colorado Fuel and Iron Company for a number of years. The committee on sanitation and housing in each district makes regular trips of inspection to all the properties, on that the physical condition of the camps, always good, is kept up to standard—even improved by the building of near fences and the offering of prizes for lawns, vegetable and flower gardens. In the field of recreation a committee has charge of an annual picnic and field day and encourages such recreational activities as the organization of baseball teams. In some of the camps where interest is keen the company has built a frence around the ball park and put up a grandstand.

#### No Opportunities for Child Labor

THE educational problem in the mining camps is an unusual one. There is less reason for children leaving school at an early age than in most communities because there are no child-labor industries appealing to the cupidity of parents or the scal of youth. The only industry is mining. Boys are not permitted, under the law, to work in mines until they are six-ten years old. For the girls there is no occupation but housekeeping. Yet until last year the schools in most of the camps lad gone no further than the eighth grade.

The company has encouraged the school boards to extend the schools by adding two years of high school work. This year, by an arrangement with the school board of the city of Trinidad, the superintendent of the Trinidad schools will extend his supervision over the schools in the surrounding coal

camps. In addition, the work of the teachers in the camps has been greatly stimulated by conferences held in Trinidad during the past two years under the direction of the state superintendent of schools, and financed by the company.

Although not officially a part of the Rockefeller Plan, he work of the Young Men's Christian Association is coming to be so important a factor in the camps that a reference to it should be made. As in all of its industrial work, the association has an agreement with the company that a building is to be furnished, rent free. In addition, the company makes a contribution to the association in each of the sixteen camps where it is located which is about equivalent to the salary of the secretary. The secretary is directly responsible, however, to the state committee of the Y, M, C, A, and receives his salary from them.

Membership in the Y. M. C. A. in these camps coats fifty cents a month, but in all of them the secretary keeps open liouse for the camp, regardless of age, membership or sex. In some places the association is housed in the old saloon building, which was the hang-out for the camp before the state went dry. In others the company has built large, well-quipped buildings. The one at the Berwind-Tabasco camps, for example, cost \$15,000, and is admirably adapted to the purposes of a clubbouse.

#### The Y. M. C. A. Women Secretaries

AN INTERESTING extension of the work of the Young Men's Christian Association is the employment in some of the larger camps of women secretaries known as "social workers," who devote their time to the women and girls of the camp. They organize the Camp-Fire Girls and their junior auxiliary, the Blue Birds. They take the girls picnicking or on hikes, they teach classes of older women in dieretics and in household economy. In general they act as guide, philosopher and friend to the women of the camp. These omnipresent ladies work under the direction of the Y. M. C. A., but receive their salaries directly from the company.

Neither is the medical work an essential part of the Rocketeller Plan, but it should be included here as an important part of company policy. Every employe pays one dollar a month and is entitled to medical service for himself and all ordinary service for his family. There is a doctor in every camp and at the head of the service is the hospital at Pueblo. under the superintendence of Dr. R. W. Corwin. A recent development is the employment of a dentist and an oculist to examine the teeth and eyes of all the school children in the camps. There is a visiting nurse at Primero and at one of the other camps. One thing that every camp needs badly is an emergency hospital to take temporary care of badly injured men before they can be moved to Pueblo. At the iron mines in Sunrise, Wyo., and at Primero, in the coal fields, two such emergency hospitals have recently been built and equipped as the personal gift of John D. Rockefeller, Jr. Plans are under way for the erection of similar hospitals in all the camps, This is the latest chapter in the story of Rockefeller and Colorado. It's a better and more hopeful chapter than the others, but it isn't the end of the book. What the next chapter will be like or how long it may take to write it one can

do no more than conjecture; but of this we may be sure-it

will tell a story of democracy re-enforced and growing in

#### NO PLACE IN GREAT BRIT-AIN FOR IDLERS

SIX-HOUR day and everybody at work is the prediction for England's industrial future recently made by Lord Leverhulme, the head of the famous Lever Brothers soap works at Port Sunlight, England, where several thousand workers are employed. According to the New York Tribune. Lord Leverhulme, who is also this year president of the Welsh National Eisteddfod, declared in a recent interview that the tremendous burden of the national debt can be borne, after the war, only if everyone is a worker and if the strength of the whole nation is conserved by taking advantage of what has been learned about fatigue.

The logical consequence of the new understanding that it doesn't pay to overwork people, Lord Leverhulme declared, was to work the machinery longer, and men and women fewer hours. "By means of six hours' shifts for men and women," he said, "we must work our machinery twelve, eighteen or twenty-four hours a day."

The effect of this arrangement would be not only to stimulate output, but greatly to aid in the improvement of the condition of the people by giving opportunity for education. So long as education is impossible, as it is under present work schedules, and so long as housing conditions are poor, "how can we wonder at what is called 'labor unrest'?"

Not only can we produce, Lord Lever-hulme went on, when all ranks and all classes of both sexes are workers for six hours each day for six days cach week, all the ships, machinery, factories, homes and goods we require. but the homes can be built in beautiful, garden suburbs; we can provide adequately for education, mental and physical, and military training for national defense.

In addition, all being workers, our burden of taxation will—being then wisely laid on wealth produced—be borne by all without impoverishment or oppression on any. There must be no idle overfed and underworked men or women or no overworked underfed men or women.

It has been estimated, the speaker declared, that only half of the population of the United Kingdom are producers of wealth. If the war is to be won and "our position" maintained afterward,

then it will require that all able-bodied men and women, from school age to dottage, of all ranks and stations, shall be workers for six hours each day for six days each

There will be no place in the whole British Empire for the idle rich or the idle poor. We cannot consent as a nation to there being any loafers, nor can the British Empire become a loafer's paradise if it is to continue to exist.

# THE MEN WHO LEAD THE CAMPS IN SONG

N his article on another page of this issue, Joseph Lee places music among the first things that keep soldiers well and gives instances of the value of mass and gives instances of the value of mass singing for the morale of the young recruits under training. The selection of men with the ability and right spirit for leadership in song at the camps was and remains a delicate task for the Commission on Training Camp Activities.

They have to be men who can fraternize, with whom good fellowship is instinctive, who have good voices and know
how to use them, men who can "stand
the gaff" of raillery—for the army and
navy song leaders have a very different
task from that of the choral society director. Usually they have to get along
without supplementary music, often they
have nothing more than a lumber pile
to serve as a conductor's stand—until
the carpenter needs the lumber and takes
it away. They must manage with little
time for practice, sometimes without
much light and without song books.

October 6, 1917 Vol. 39, No. 1
THE SURVEY
Published weekly by
SURVEY ASSOCIATES, Inc.
112 East 19 street, New York

Robert W. de Forest, president; Paul U. Kellogg, editor; Arthur P. Kellogg, secretary; Frank Tucker, treasurer, 25 cents a copy; \$3 a year; foreign postage \$1.50, Canadian 75 cents; Copyright, 1917, by Survey Associates, inc.

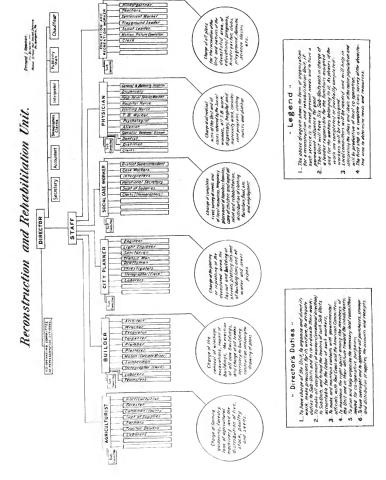

Inc.
Entered as second-class matter March
25, 1909, at the post office at New York,
N. Y., under the Act of March 3, 1879.

If enough men did not exist to fill the new job, its splendid opportunity has created them. Thus Geoffrey O'Hara the young composer, in a few months accomplished remarkable results in the big mobilization camp at Fort Oglethorpe, Ga. Kenneth Clark, music critic and composer of many of the Princeton University songs, did the same at Allentown. Robert Lloyd, at Fort Niagara, added a voice-training course for officers to his work. Stanley Hawkins taught the officers at Madison Barracks, N. Y.

During the summer, a National Committee on Army and Navy Camp Music has been created upon which serve W. Kirkpatrick Brice, treasurer of the New York Community Chorus; Max Morgenthau, Jr., of New York; John Alden Carpenter, the Chicago composer; Mrs. George Barrelle, of Buffalo, and Lee F. Hanmer, of the Russell Sage Foundation. Frances F. Brundage, supervisor of the Chicago Civic Music Association. was secured as executive secretary. This committee, with the help of Harry Barnhart, leader of the New York Community Chorus, is conducting this fall a short training course for leaders in New York.

In the meantime, other men of the highest standing have come forward to aid in this great effort: John Archer, who has organized large choruses in Providence, Pittsfield and North Adams, Mass., Holmes Cowper, dean of music at Drake University, Des Moines, Iowa; H. W. B. Barnes, formerly head of the San Antonio, Tex., School of Music; David Griffin, concert baritone of Philadelphia; Albert Hoxie, leader of the Philadelphia Community Chorus; Herbert Gould, of the Chicago Civic Music Association, and others whom space does not permit us to name.

The compilation of a new army and nassy song book is another task which the committee has set itself. The first edition of a million copies is to be ready this month. It will contain the best of patriotic and folk songs, old hymns, and some new songs. Among these will be songs which have already made a wide

appeal to American soldiers, including the most popular marching songs of their British brothers in arms. The stately Hymn of Free Russia and Farwell's March, March will be found beside popular favorites with a sectional appeal—songs of the Dixie type.

Incidentally, this great undertaking will strengthen national unity even outside the ranks of army and navy and beyond "the duration of the war." people of this country will, for the first time, be provided with the means of common self-expression by being taught the same songs. Already a second edition of the army and navy song book is in preparation, with mandolin and guitar arrangements for glee clubs, and a third edition, with the customary piano accompaniments, for general sale, last-named edition will be largely used in the community choruses of the country so that "the men who return will find that the folks back home have been keeping step with them in song."

#### A PLAN FOR REBUILDING EUROPE

THE chart of a proposed American reconstruction and rehabilitation unit for service in Europe, reproduced on the opposite page, was designed by Bernard J. Newman, director of the Pennsylvania School for Social Service, as a result of the many calls that came to him to give advice and direction to those who were eager to help the people of the devastated sections of Europe.

It takes but a glance along the row of titles from agriculturis to education and recreation worker to get Mr. Newman's point of view; restored houses, and reclaimed fields, of course, but not merely restored to the old order. The city planner and the tractor drivers suggest the introduction of new and improved ways of building cities and doing the world's drudgery. And the three boxes to the right of the city planner completely reveal Mr. Newman's ulterior motive—not only better houses and better fields, but better boys and girls, finer une and women.

He would have Americans take vocational training and guidance, better tetch, better food, less disease, more education and play, a richer life to these people who have endured so much. In short, if we intend to give, let it be the best that we have, something lasting, something vital, something human and spiritual to go along with the bricks and mortar.

The division of the reconstruction work into definite assignments to corps of specialists, is a point that those in charge of equipping such units will also find stimulating. In fact, this little plan would seem to be a challenge to those who would undertake this work in a less comprehensive or less systematic way.

## THE SALVATION ARMY AT

OVER \$900,000 had been spent by the Salvation Army in France and Great Britain on the construction and maintenance of more than 200 rest rooms, 183 hutments, 70 hostels and 35 ambulances before this country entered the war. At the beginning of August, the first American contingent of Salvationists, consisting of twenty officers, sailed to begin work among the American soldiers in France. They will be

commanded by Maj. G. Anderson.

Army huts and rest rooms have also been opened and are being opened at many of the cantonments in this country where the new draft army is undergoing training. It is intended, further, so far as funds permit, to open Salvation Army rest rooms in every city near a camp site or where soldiers in large numbers are quartered in armories. The movement has the cordial approval of Secretary of War Newton D. Baker and is in heartiest cooperation both with the Red Cross and with the Y. M. C. A.

"While there may be points of similarity," one of the national officers writes to the Survey, "our work is no more a duplication of the Y. M. C. A. work than theirs is of ours. We work largely with similar tools, but with the emphasis ever placed upon salvation."

"They go," said Commander Evangeline Booth when appointing the Salvation Army "selective draft" for service in Europe, "to comfort and encourage in every way possible—with rest rooms, refreshment bars, recreation arrangements; with song, with music, with despatching and securing messages to and from the boys' homes; with the Bible, with affection, with advice, with teaching, with prayer and with a glad spirit."

That the Salvation Army in these various endeavors is making a distinctive contribution to social service is illustrated by many telling passages in the personal accounts of two of its officers who have given their experience in book form. They bring a message of love to men surrounded by evidences of hatred and a message of forgiveness to men tortured by the feeling of guilt for shedding the blood of fellow men.

"The more I talk to the men," says Adjutant Mary Booth (With the B. E. F. in France, Salvasion Army, London, 1916), "the France, Salvasion Army, London, 1916," the natural for a man to want to kill another man. I am more than ever sure that the religious instinct which has been dormant in many a man's soul is often suddenly awakened when he is face to face with hard-ship, suffering and death.

". I have often entered a hospital ward wishing I were a doctor or a nurse and could heal some of the broken bodies of our brawe men; but I left this one thanking God that I was a Salvationist, if only to help that one poor wounded man, who felt his load of sin too heavy to bear, and to help him to find peace."

"In a word," writes Arthur E. Copping, who attempts to define the menial affinity between soldier and Salvationist (Souls in Khaki, Hodder & Stoughton, New York, Khaki, Hodder & Stoughton, New York, and the state of the state

#### RED CROSS PLANS FOR THE REFUGEES

THE American Red Cross announces the appointment of Edward T. Devine to the position of chief of the Bureau of Refugees and Home Relief under the American Red Cross Commission in France. Maj. Grayson M. P. Murphy, head of the commission, cables from Paris:

In the various departments outside the Seine there are some \$50,000 refugees embracing all classes and ages except ablebodied men. Although employment at good wages is general, these refugees are nevertheless in a unfortunate condition because the complete the condition because the complete of the condition because the condition of the conditio

The Red Cross hopes to aid the authorities to tesses this congestion by supplying furror those move into better quarters, by competing buildings already partly constructed, and even by furrishing portable houses of cheap construction, when necessary, as a temporary makeshift.

It is proposed to establish, in connection with the French authorities, health center from which useful work can be done in such a way as fully to conserve the self-respect and independence of those who accept it. There are many voluntary agencies, as well as public relief authorities, through whom the Red Cross can give assistance.

Dr. Devine's immediate task will be to coordinate those agencies and arrange for constructive relief for those victims of the war who cannot yet be returned to their own homes. Later it is hoped that there will be abundant opportunity for them to be reestablished in the busy and fruitful regions in which they lived before the war.

# THE CHILDREN'S BUREAU ON DEFECTIVES

"PROTECT the defective children, proper care, and you will lessen the burden of dependency and delinquency." This is the gist of the advice contained in a new report on mental defectives issued by the federal Children's Bureau. The report is based on a study of the social conditions of 212 mental defectives in New Castle county, Delaware. A total of 175, or more than four-fifths of these, were in need of public supervision or institutional care because of bad home conditions, physical helplesness, or pronounced anti-social tendencies, and only 12 of them were provided for in an institution adapted to their care. Twenty-six of the defective children were in industrial schools for de-linquent children, and of these the report says:

Institutions for the care of delinquent childran are greatly handicapped by the presence of defectives, since they require special attention and exert a bad influence over the normal children. After a short period of residence these defectives are returned to the community without sufficient supervision.

Other defective children with delinquency records were at large in the community; in all, 98 of the 212 defectives studied were delinquent or immoral or difficult to control.

The report suggests that while any program for the care of mental defectives must have as its central feature suitable institutional provision offering training or custodial care according to the needs of the individual, other activities are equally essential. It is pointed out, for example, that institutional care is not necessary for all mentally defective children, for, contrary to the popular impression, it is found that there are certain types who can safely remain at home provided they have the attention and study which they deserve. However, special provision should be made for their safety, care, and education, and out-patient work of an institution for the feebleminded, in cooperation with schools, social agencies, and families, is referred to as a new and important method of providing in the most humane possible way for such children.

The possibilities of industrial training by which certain types of defectives may gradually become in part self-supporting and the importance of providing facilities for mental examination and diagnosis of doubtful cases are also brought

#### TUBERCULOSIS IN CAMPS AND HOMES

HAT America's entry into the war may result in the reporting of more than 3,000 cases of tuberculosis in this country annually while war lasts is the possibility discussed by Louis I. Dublin, of the Metropolitan Life Insurance Company, in a paper read this week before the North Atlantic Conference of the National Association for the Study and Prevention of Tuberculosis-the first of four regional conferences. Proof that the anti-tuberculosis movement had made itself felt definitely through its campaigns of the past quarter-century was to be found, Dr. Dublin said, in the lowered death-rate from this disease:

In the short period since 1900 the tuberculosis death-rate has declined over 25 per cent, which is considerably more than the decline in the death-rate from all causes. . . In some states the death-rate is as low as in any part of the civilized world. Kansas, for example, had in 1915 a rate of 47.9 per 100,000, while in Utah, the rate was only 26.1.

Such is the situation as this country enters the war. But European experience shows how vital is the relation between tuberculosis and war as at present carried on. Dr. Biggs believed [the SURVEY for May 5, 1917] 500,000 cases a conservative estimate for France; a recent report of an increase of 50 per cent in certain German cities has been received; figures of the registrar-general of England for 1915 show more than 16 per cent increase over those of 1914; Holland's rate is said to have advanced from 154 in 1915 to 180 per 100,000 in

1917; and, nearer home, Ontario also reports increase.

Such facts, says Dr. Dublin, make it clear that the conditions of modern war bring about higher tuberculosis rates, not only for the man in the ranks, but also for the civilian population.

What all this means specifically for this country, Dr. Dublin thinks may be foreseen by noting certain changes resulting from participation of large numbers of men in the war; then changes which may be expected in the civil population. First, for instance, the medical examination of drafted men will disclose a large number of cases, unsuspected or hitherto concealed. How many cases will be thus discovered may perhaps be estimated from recent studies of conditions in the industrial field, which showed that from 1 to 3 per cent of the persons examined were tuberculous.

Then, published death-rates are significant, even though the registration of tuberculosis as cause is still incomplete, and many cases of the disease die from other causes—accidents, pneumonia, etc. Within the registration area, the tuberculosis rate for males between the ages of 20 and 30—practically the draft age is 200 per 100,000. Since from 5 to 10 active cases may be estimated for every death, the total of 1,000 to 2,000 per 100,000 is reached. This proportion agrees strikingly with the findings of the industrial investigations just referred to.

If, therefore, says Dr. Dublin, we use the figure 2 per cent as the measure of active tuberculous's cases in the population at the draft ages, we certainly shall not be guilty of over-statement. On this basis there will be found in round numbers, 200,000 cases of the found in round numbers, 200,000 cases of subject to the draft examinations, that is at the single age period 21 to 31, and for men only. We know that there are many who on the basis of their long experience of tuber-culouis work will insist that there are two or three times as many true exaces, but it will ment that follows on the very moderate figure of 2 per cent.

Full confirmation of this estimate depends, of course, upon the final reports of all medical examinations-figures which are not yet available. But Dr. Dublin quotes the findings of several individual exemption boards: In one of the best residential districts of Chicago. 98 men out of 1,525 were rejected because of tuberculosis-a ratio of 6.4. These rejections were made only after four thorough examinations. In some counties of North Carolina the rejections numbered 5 per cent; the yet higher rate from Illinois requires further confirmation; California has already referred 1,054 men to specialists for further examination. Even more striking is one report from New York, where X-ray examinations of men enlisted in one of the National Guard regiments (and therefore not new recruits, but men whose physical condition had already

been certified) showed 3.6 per cent sufficiently tuberculous to disqualify them for military service, and 3.2 per cent requiring further examination to determine the actual extent of the lesions—total, 6.8 per cent.

From this, it may be concluded that only a small proportion of cases are known to the state boards of health, at the present time; a larger number are known to the medical profession and to patients themselves, but probably not more than one-quarter of this number are receiving proper medical attention.

The first effect of the war will be to increase enormously the number of known cases of tuberculosis—but this, Dr. Dublin holds, must not be taken to mean an increase of the amount of the disease. And it may well be that as a result of such findings, many state and local authorities will decide to extend the examination for tuberculosis among other age periods and among women, in order to discover the extent to which this menace prevails among the population at large

But Dr. Dublin's argument is not limited to war times. A certain amount of tuberculosis exists in every army. The rate in the United States army for the year 1915 was 3.5. It is found that a soldier rarely becomes infected while on active duty; the majority of cases develop during the first year or during the period of training; hence probably these cases were suffering from either latent or arrested lesions before they entered the army. If the 1915 rate continues, the discovery of 3,500 new cases may be expected yearly, as new men come into service.

Everything will depend, of course, upon the degree to which the military authorities will make known to the state departments of health the cases of tuberculosis which they discover through the draft examination. . . . The first effect of the war upon tuberculosis

The first effect of the war upon tuberculous may then be considered as a distinct gain to the anti-tuberculous movement. . . The figures for many years will not look so well as before the war, but the increase in the number of cases will be indicative of progress rather than of retrogression and will serve as the first step in a radical and constructive movement for the control of the disease.

It is undoubtedly true, Dr. Dublin recognizes, that, as compensation, the period of training will for many individuals be a distinct improvement over their previous habits of living. Life in the open, systematized work and exercise, wholesome and sufficient food, sanitary conditions and military discipline should prove of much benefit.

As to the civilian population, it is true that in England, despite the long campaign to control the disease, tuberculosis has increased during the period of the war. That this increase is largely among males may be because the strongest men have been called to service. The statistics of women doubtles represent more

# The Instant Summons

"Instant, through copse and heath, arose Bonnets and spears and bended bows;

As if the yawning hill to heaven A subterranean host had given."

The whistled summons of Roderick Dhu, the hero of Stott's "Lady of the Lake," caused his Highland warriors literally to spring from the earth. Ere the echo died away, from behind bush and rock emerged the loyal and ready clansmen. In armed silence they awaited their chieftain's bidding and typified his might.

Today the Commander-in-Chief of our nation's armed forces and the resources behind them, can, by lifting the telephone receiver, instantaneously set in motion all the vast machinery of warfare, munitions, transportation and food conservation.

Like the Scottish mountaineers, the American people must stand in loyal readiness to perform any service in furtherance of the nation's high aim. Such a spirit of co-operation and sacrificing of individual interests can alone make certain the accomplishment of the great task to which our country is committed.

accurately the true conditions. The increase, which is apparent at all ages over 10, is probably traceable to their employment in industries, the speeding up of work connected with the war, coupled with a general lowering of economic conditions, especially the reduced food supply and the deterioration in civil medical service.

The program for these new conditions must include, Dr. Dublin believes, each of the factors mentioned: the physical, with results of the draft boards' examinations as a starting-point; the economic, lest straitened conditions spread the disease through the civil population:

In conclusion, he says, we would urge that our first duty if we would profit by the experience of European countries, is to exclude the tuberculous from our armies at the very beginning and to provide medical treatment on a large scale for the huge number of men who will for the first time become aware of their impaired condition; and, second, to provide the means for a searching inquiry provide the means for a searching inquiry cannot be seen to be a searching inquiry cannot be seen to be

#### BABIES IN WAR-TIME AND AFTER

PARTLY as a war-time emergency measure, the Massachusetts State Department of Health is launching an enterprise to care for every child in the state who needs care. This task of conservation will be accomplished by the cooperation with the department of many nursing agencies, the Women's Committee of the State Council of Defense and the Red Cross. In outline, here is the plan of work:

In each of the eight health districts into which the state is divided by the Department of Health, a special public health nurse will be placed, a woman who has had training and successful experience in child welfare. After conference with the district health officer. this nurse will go to each city or town in her district and make what is practically a survey of conditions, ascertaining from the local health officer, from nursing organizations and any other child-welfare agencies just what is now being done there, what needs are still unmet.

The questionnaire used in this preliminary looking over the ground follows closely that published by the federal Children's Bureau. It shows the provision or otherwise of pre-natal service. obstetrical care, and "well-baby" as well as "sick-baby" clinics, and asks for the local worker's opinion as to what is the most urgent need of the babies in her immediate bailiwick.

It is planned that following this gathering of facts shall be abundant publicity to acquaint people with the various agencies nearby and how these may be of service to them. The first of these surveys was made in Boston. The need was not the same in every one of the twenty-six wards; in one place, sick-baby clinics were considered advisable; and in others, well-baby clinics. The need of pre-natal work was evident everywhere.

The interest in this plan already shown would indicate that localities will, when possible, undertake whatever is necessary or desirable for their children's welfare. That the community itself meets the responsibility, its local agencies working together, with any needed assistance and advice from the State Health Department, at once establishes the work upon a permanent basis, making it much more than a war measure, and also insures that specific needs of the individual community will be known and met.

At headquarters the committee in charge, appointed by Dr. Allan J. Mc-Laughlin, state commissioner of health, consists of Dr. David L. Edsall, Dr. William J. Gallivan, and Dr. Lyman Asa Jones. Advisory members are Dr. R. L. DeNormandie, Dr. Walter Fernald and Dr. William Healy, who will advise on matters of delinquency and

#### INDUSTRIAL UNREST TO BE STUDIED AGAIN

HE Mooney case witness who wrote The Mooney case with a state ould to a man in Illinois that he could make all his expenses and "\$100 in the clear" if he would come to San Francisco and "say you seen me on July 22"
-F. C. Oxman-was last week acquitted of the charge of subornation of periury. Immediately after his release he was rearrested on a warrant charging him with perjury, sworn to by Belle Hammerburg, a sister of Mrs. Mooney. This charge will bring again into court the testimony that convicted Mooney [the SURVEY for July 7].

Oxman swore that Mr. and Mrs. Mooney, Weinberg, who is charged with complicity in the crime, and another man drove down Market street in the face of the oncoming Preparedness Parade and openly placed a suitcase containing a bomb at the corner of Steuart street. To do this they must have driven nearly a mile on a street from which all traffic in either direction had been barred by police order, and on which a policeman

was stationed every 100 feet.

Interest in the San Francisco bomb

case has been re-awakened in the East by two events of the last few days. Last Monday Governor Whitman of New York granted a hearing to a delegation of trade unionists who protested against the extradition to San Francisco of Alexander Berkman, who has recently been indicted on a charge of complicity in the crime. It was pointed out to the governor that Berkman lived in San Francisco for months after the bomb explosion and that his office and personal effects were searched more than once by the police, yet he was allowed to leave San Francisco without interference. Now, more than a year after the crime, he is indicted and an attempt is made to bring him back in a spectacular manner, the governor was told, in order to lend color in the public mind to the idea that the bomb explosion was an anarchist plot. Governor Whitman reserved decision until he could have opportunity to examine the minutes of the grand jury that brought the indictment against Berkman.

The other event that is of interest in this connection is the departure for the West of the commission recently appointed by the President, with Secretary Wilson as chairman, to investigate industrial unrest. It became known that the commission will make a thorough investigation of the bomb trials in San Francisco. President Wilson is said to have taken a strong personal interest in the matter and to be anxious to have all the

seem that, three years after the dissolution of the Industrial Relations Commission, the President has appointed another commission to the same task.

#### TO MAKE HALLOWE'EN SAFE AND SANE

W HILE much has been done to free the Fourth of July of dangerous features, only recently has a move been made to free Hallowe en of rowdy-ism and to direct the animal spirits of youth toward a festival of real merriment, beauty and educational significance.

At Fort Worth, Tex., for instance, the Park Board, the School Board and the Recreation Committee last year united with the Fall Festival Association in giving a great masque and pageant which brought together tens of thousands of people in common enjoyment. Nearly four thousand school children took part in a series of tableaux, a crowd thronged the park during the afternoon festival, and more than sixty thousand persons from far and wide came at night to view the carnival on the streets.

the streets.

The subject of the pageant, Elbert M.
Vail, superintendent of recreation, writes to the Survey, was Preparedness for Peace. Its aim was fourfold: to awaken civic consciousness to a realization of the loftiest ideals of peace—not peace snatched at intervals from the black horrors of war, but an abiding, all-embracing peace made possible by the botherhood of man; to demonstrate the place of supervised play, recreation and physical training in the development of a race fit for peace and war; to make the citizens appreciate the possibilities of their recreation centers; and to arouse a community spirit.

The afternoon pageant was carefully rehearsed, gorgeously costumed and beautifully staged in the huge natural amphitheater of Fort Worth's largest park. After the singing of Columbia, the first episode showed the return of Columbus to the court of King Ferdinand and Queen Isabella after the discovery of America. Dutch children and Pilgrim Fathers symbolized another strain in America's make-up. William Penn and his quiet band of Quakers were seen parleying with the Indians; France bringing aid in the War of Independence, the colonial life of the times, the opening of the Orient to American trade were other subjects falling into the general scheme. America's welcome to the immigrant, a massed drill of boys and girls, typifying the merging of her component races in a new commonwealth, and the Spirit of Peace followed in sequence. The different decorated floats of the evening parade more or less repeated the scenes of the earlier program.

Fort Worth knew, writes Mr. Vail, that this was to be her first great full fessival; but she eame later to realize that through it she had solved her Hallowe'en problem. Thousands of revelers were in costume. The multi-colored costumes, the happy give and take of the throng, the shrill piping of the horns and the music of the bands added

multi-colored costumes, the happy give and take of the through the shift lipping of the deleter of the color of the color

Another successful solution of the Hallowe'en problem is offered by Allentown, Pa. In this community of some 61,000 people, which prides itself upon its old customs, the Hallowe'en parade is a yearly event, designed to give legitimate outlet to the mischievous spirit of the day. City officials take the lead and arrange the meeting places for the various wards.

In last year's demonstration, each division was headed by a band, sixteen in all, and seven thousand persons paraded in costume. Sometimes groups would appear in uniform costume, a row of follies or of football girls. The college boys marched in the time-honored costume for this occasion, the ghostly night-shirt. Some of the more enterprising merchants provided floats. Clowns in large numbers, Zulu chiefs, ghosts, Charlie Chaplins, Uncle Sams were to be seen everywhere.

"I bought some calico for about twenty-seven cents," one hard-pressed little mother told Lucy J. Collins, who reported these events to the SURWEY, "and worked until twelve o'clock to make it for him. But it was all right; he can march."

No one was too rich or too poor to be in the fun. At ten o'clock, after an evening spent without the slightest disorder, everyone went home—little clowns sometimes carried in the strong arms of big clowns. There was no work at police headquarters beyond the reprimading of a couple of youths for talcumthrowing.

Allentown, by the way, has another unusual community festival. At the close of the playground season every year the children from each of the four-teen supervised playgrounds, with their parents, meet together on the fair grounds for Romper Day, celebrated by contests in volley ball and other games, folk-dancing and all fresco lunching. In this instance, as in the other, rich and poor meet on a footing of perfect equality of dress and action.

#### SITUATIONS WANTED

EXPERIENCED house mother, with daughter, school girl, desires position child-caring institution. Address 2602 Survey.

WANTED—A position as recreation instructor or play leader. Preferable, Chicase. Experienced. Trained. References exchanged. Address 2609 SURWEY.

THE CHALLENGE OF THE PRESENT CRISIS
Foodick's New Book—Harry Emerson Foodick
(Paper boards, 50 cents)

The author of "The Meaning of Prayer" and "The Manhood of the Master" again above his remarkable skill for summing up what men are thinking about. The war-induced pessimism regarding Christianity, the Christian attitude toward war, the challenge of the present crisis to the Church and the individual are recognized in all their enormous seriousness—yet the message of the book is one of stirring outnition.

FOR FRANCE AND THE FAITH
By Alfred Eugene Casalis—Translated by W. E. Bristol
(Paper boards, 60 cents)

Fragments of letters written from barrack rooms and the front by a young French soldier. These letters of unusual charm reflect the spirit of the consecrated youth of France, the courage, partiolism, and large vision of duty which a soldier of Jesus Christ owes his country as well as his God. "I have seldom read anything more sincere and more touching: profoundly thoughtful and yet perfectly simple and matural."—Hon. James Bryce.

15. Interest of the Control of the C

# Sabotage and Disloyalty

By John A. Fitch

OF THE SURVEY STAFF

DVOCACY of sabotage is the principal element of danger in the I. W. W. Sabotage is the carrying on of the class struggle while at work. It is so far as to put the establishment out of business, but omust raise Cain on the job. You must do something that will cause endless delay and vexation; turn out spoiled or damaged goods; mix up orders and shipping directions; slow up without utterly destroying machinery; harass the boss all you can without getting caught.

That's the theory of sabotage and it's vicious, not only because it is underhanded warfare, but because it destroys things of value. It decreases production and so, instead of creating anything beneficial to the workers, it decreases the stock of goods and thus lessens the possibility of adequate satisfaction of human wants.

Worse than the act itself, though, is the spirit of sabotage. The theory of it may not include absolute destruction, but can a man acquire the habit of putting sand in the bearings without ever desiring to smash something with a crow-bar? The theory does not include taking human life, but can there be sabotage among bridge-builders and no danger to life? Can there be sabotage where steel rails are made, or brakes for automobiles, or steel cables, or in the mixing of cement or the laying of brick, and no probability of human destruction? Indeed, is it possible that men who stop at nothing in the way of interference with machinery, in order to gain their ends, will never contemplate the taking of life?

It's the spirit of sabotage that constitutes the real danger. However the leaders may attempt to define it and set limits to it—however much they may discriminate, and say that this is sabotage and that is not, the fact remains that actions are not controlled by definitions. The advocate of sabotage is turning loose in the community a force which he cannot check and which may result in consequences far beyond his intention.

This, it seems to me, is the chief reason for opposing the I. W. W. propaganda. It is certainly a sufficient reason. But is it also a reason for charging them with various and utterly dissociated crimes? Or is it a reason for denying them the caula protection of the laws?

Certain recent events, including the indictments by a fedever unjustifiable or lawless, that m The Survey, October 13, 1917, Volume 39, No. 2, 112 East 19 street, New York city

eral grand jury against 166 members and sympathizers of the 1. W. W., and the general public attitude toward them, make these questions pertinent. Federal officers here and there all over the country are arresting the persons indicted. In due course they will doubtless have their trials and we shall then learn the nature of the evidence in the possession of the government.

In the meantime, two things seem to me rather clear, and incidentally, fairly good American doctrine. First, that if I. W. W. members have sought to weaken the military power of the government they should be restrained and punished; second, that this cannot be determined in advance of a fair trial and that, consequently, until such trial the defendants must be presumed to be innocent. It may be that some of them have been guilty of seditious conduct. It is not at all likely that all of them have, nor that all of those who may be convicted are equally guilty. It is reasonable and decent, therefore, to withhold judgment.

Yet we find that in a majority of the newspapers of the country the indicted members of the I. W. W. have already been tried and found guilty. Despite the fact that we do not yet know what evidence the government has to present, some of the newspapers are going wild over the fact that William D. Haywood made arrangements to have Pouget's book, Sabotage, translated into Finnish. Sabotage is a pernicious doctrine, as I said above, but preaching it does not constitute seditious conspiracy, as the newspaper writers very well know. Moreover, we have known, since the I. W. W. was organized, in 1904, that one of its doctrines is the practice of sabotage. It was partly on that ground that Haywood was eliminated from the Socialist party in 1913. It isn't a new discovery, It's no basis for the charge, therefore, in 1917, that Haywood and the others have been too close to German influence for toleration in a country at war with Germany. There may be such evidence, but if so it lies elsewhere than in the doctrines that for a dozen years have been openly preached and practiced.

Growing out of this newspaper attitude is a tendency even more serious because more widespread—a hor-headed intolerance that will believe any accusation of the I. W. W., however unsupported by facts; and support any aggression, however unjustifiable or lawless, that may be directed against

them. Because of this tendency, unscrupulous employers are endeavoring to take advantage of the disrepute of the I. W. W. in order to further their own ulterior ends. Hardly a strike occurs in which the cry of "I. W. W. influence" is not immediately raised. The street car strike in San Francisco, now in progress, was ascribed to the I. W. W., though it is being handled by a representative of the Amalgamated Association of Street and Electric Railway Employes, a union affiliated with the American Federation of Labor. The strike of iron workers in the shipvards, all members of unions affiliated with the American Federation of Labor, was said to be fomented by the I. W. W. The move for an eight-hour day in the lumber camps of Washington, endorsed by no less a person than Newton D. Baker, secretary of war, was denounced to the world as a part of the I. W. W. conspiracy to injure the government.

The evidence that is most outstanding, of this state of mind, at once intolerant and susceptible to the artifices of unscrupulous employers, is that concerning the recent deportations of strikers in the Southwest. The strikes in the copper regions from Butte, Mont., to Bisbee, Ariz., were based on legitimate grievances. The intolerable "rustling card" system, which is nothing but an automatic blacklisting device, was in itself sufficient to warrant the most vigorous sort of a protest.

Furthermore, the strikers were not all members of the I. W. W. by any means. Members of the Mill, Mine and Smelters' Union, affiliated with the American Federation of Labor, were also on strike in Bisbee, and they, together with other citizens who belonged to neither organization, were deported by a mob who called themselves—Heaven save the mark—the Loyalty Leaguel

That it is more than a desire to combat a seditious conspiracy that has led to these illegal activities is shown not only by the indiscriminate kidnappings at Bisbee, but by an incident in another state, connected with an altogether different union. Members of the United Mine Workers were on strike at Gallup, N. M., to enforce a contract. Under cover of the Bisbee excitement and the charges of disloyalty, men were deported from Gallup by citizens presumably inspired by a loyalty quite similar to that of the Loyalty League.

This incident is sufficient to make it clear that legitimate endeavor for the purpose of improving the condition of the wage-earners is likely to be opposed just now in violent and unusual ways. It is pertinent, therefore, to recall the fact that the purposes of the I. W. W. are not utterly destructive. Whatever one may say of their philosophy, they have espoused the cause of a class of workers who had no one else to plead their case and who have been desperately exploited—the casual and unskilled laborers. They have infused into this class a new hope and to some degree they have been responsible for an improvement in its condition. It must not be overlooked that activities of that character, and not alone cooperating with the enemy, are sufficient to arouse the bitterest opposition from those who profit by exploitation.

It is most disheartening that these exploiters can resort to extreme lawlessness in the furtherance of their ends without evoking a protest from the public. Because of this spirit of acquiescence, the dread initials of the Industrial Workers of the World can be used not only to injure the legitimate labor movement everywhere, but also as a red herring across the trail of those employers who do not heistate to use the nation's plight as an opportunity to strengthen their own unjust practices.

There can be no two opinions about the necessity of suppressing treasonable activities, of whatever character. There ought not to be two opinions about the injustice of accepting the outcries of interested persons as evidence of treason.

# Where's the Money Coming From?

By Elwood Street

OF THE SURVEY STAFF

DUBLICITY and finance for social organizations, always important, are of pressing concern in these war times. Social agencies are hard hit by the increased cost of supplies and food. Many will soon have added burdens. Contributions are hard to keep up because of war appeals and the uncertainty of contributors as to the effect which the cost of living and war taxes will have on their incomes and expenditures. Newspapers, full of military news, have little room for the material which social organizations try to have published. The social agency which would get public attention and interest and capitalize this interest into contributions must adopt more effective methods than have been in vogue in the past.

Publicity and finance of social work are inextricably connected. An organization which needs funds must make its work known to the public. Publicity without financial purpose is, of course, of educational value, but is most effective when carefully coordinated with efforts to raise funds. This financial work need not be apparent. It may be carried on under cover of the publicity. Identical material may be used in newspapers and appeal letters, and points thus driven home in a variety of ways. The methods most successful in publicity—the securing of attention, the arousing of interest, the securing of understanding, the getting of decision and the inducement of action—are equally effective for appeals. The same need for simplicity, directness and human interest exists in both. Contributions both grow out of publicity and follow it; the question of publicity will be considered first.

Social workers have had so many problems of technique and organization to solve, have struggled against such crippling financial difficulties, have, indeed, been so unversed in the method of informing the public of what they are doing, that they quite generally have failed either to get their message across to the public or to get it across in popular fashion. On the other hand, the newspapers, which are the chief voluntary agencies for informing the people, have understood too little of the principles of social work and have been too busy to stop and pry out principles and details from social workers, often all too crustaceous when approached by a resource.

The most valuable type of publicity is that found in the daily newspaper. Through its columns the social worker can indefinitely extend his personality. He writes to thousands and to hundreds of thousands where his own voice might reach but scores. Further value is given newspaper publicity by what Prof. Walter Dill Scott calls "social approval." The reader is impressed not only by what he is reading, but also by the fact that multitudes of others are reading and thinking the same thing. The newspaper is the most legitimate and most fruitful held for the activities of the social worker who would "get his message across."

The average newspaper editor is glad to use social service publicity. He realizes that the social agency is conducted for the welfare of the community which his own paper presumably is trying to serve. He knows that each organization has buried in it a mass of tremendously interesting material about which people would like to hear. He does not regard the man or woman offering social service publicity with the suspicion which often is the lot of the commercial pressagent.

The first thing to be remembered by the one who hopes to get the newspapers to use his material is that he must become, in effect, a member of that paper's staff. He must feel a responsibility to give to that paper all the news he can, truly, fairly, accurately and in the best possible shape. He must be courteous, patient and obliging. He must not object when a reporter rouses him at midnight to explain his view of some trivial topic. He must not shun all reporters and refuse to answer their inquiries, which often seem sensational. Such a refusal but tempts a really resourceful reporter to write a story, any way, with what meager facts he can ascertain. The social worker must take the reporter into his confidence, show him the facts and explain why some or all must be omitted. If the social worker is reasonable with him, the reporter will be reasonable too. I have never known a reporter who would abuse a confidence.

The social worker must realize the limitations of newspaper space and not complain when war or election newscombined with a big fire crowd out his pet story. He must take the attitude that if a story is rejected, it is his fault for failing to make it suit the editorial taste, and try again. He never should ask for favors, but present his material on its merits in competition with all the other matter. If such a spirit of complete helpfulness is adopted, the newspaper, delighted at being humanly treated, will come much more than half way and will voluntarily grant favors which never could have been gained if asked for.

The most obvious material for publicity is contained in what is known as the news story—of a coming meeting, play, entertainment, or scheduled event of any sort; the story of such an event when it occurs; the coming of new workers or the departure of old ones; happenings such as the sakering of a building from fire by Boy Scouts. Such stories are legitimate material for the newspaper. They must be presented while they are news—before they come, if scheduled, and certainly on the day they happen. While news stories are most useful because they let people know that the organization is on the job and in daily activity, they often can be made to exhibit some of the principles of the society. Reports presented at meetings can be made significant of the work of the organization. The coming of new workers may be the excuse for describing a principle of service.

#### Principles from Personalities

NEXT in availability to news is the "human interest" story, in which an interesting fact about some individual is told. Some worker may have a unique way of getting at his or her work. Some client of the organization may have an interesting history, which, if necessary, can be published anonymously and disguised so as to prevent recognition. Such anonymous stories require great education of your editor's point of view, but they are most helpful as revealing the successe of social work. Some boy in a manual training class may have done sepecially good cabinet work. The story of the individual will reveal some of the organization's fundamental principles. It is important to distinguish between stories which will harm the individual concerned and those which may stimulate him to better effort. The "human interest" story, when well handled, is perhaps most effective of all.

Another type is the "feature" story, describing some interesting phase of social work: An interesting study is under progress; unusual methods of procedure may be tried out; the organization may have some unique historical connections; recent experience may liave light to throw on live problems, such as illegitimacy or the training of war-cripples. Stories of these, illustrated, not only are easy to get into the daily papers, but often are available for use in illustrated Sunday magazine sections.

#### Follow the Calendar

A Phase of interpretive publicity particularly worth while is the reporting of speeches given by social workers. A few of the keynote sentences of a speech, given the newspapers, will generally be readily published and thousands will get the message.

Advantage should be taken, too, of the opportunities for "seasonal" publicity—stories about fresh-air camps and baby dispensaries in hot weather; about charity organization work in cold weather; about the opportunities of medical agencies in times of epidemic; and so on through a long range of possibilities which an active imagination will readily suggest. So-called "case appeals" may often be used with good effect. They stimulate sympathy with the organization and understanding of its work, and bring valuable help. One good scheme has been the frequent publication of "little needs of the needy" for articles such as baby carriages, mattresses and invalid chairs.

The newspaper, wise in experience, is anxious to use photographs whenever possible. A photograph about doubles a story's chances of use, attracts attention of readers and intensifies the effect of the text. On the other hand, there are obvious disadvantages in using photographs of clients, just as in the use of names and addresses. Some organizations, particularly those dealing with families in their homes, quite properly refuse to give any publicity which will identify individuals. Pictures of groups in plays or other activities often can be used. From the newspaper point of view, the number of figures in groups should be kept as low as possible and every member should be doing something definite. In other words, the picture should tell a story. An amateur photographer on the organization staff may take acceptable pictures. If such free service is not available, it is often worth while to pay for good professional photographs. Newspaper photographers may be sent if the editor is notified of a coming event. Sometimes it is possible to enter into an agreement with a local portrait photographer who will take free pictures of staff and volunteer workers for the orders lie may get and for the publicity which comes from the credit marks most newspapers are willing to attach to reproductions.

Many newspapers are eager to get charts and diagrams. Such graphic presentation of tendencies in the work of the organization or conditions in the city puts significant information vividly before the people.

A division of opinion seems to exist as to whether the social worker should prepare his own material and submit it to the papers or give it to a reporter. In spite of some expert evidence to the contrary, it would seem that the most effective to the contrary.

fective method is for the social worker to put his material in the best shape possible and submit it to the editor, rather than let the reporter gather the story from a conversation. The reason is this: Social service, though a relatively new profession, is somewhat highly technical, with delicate points of policy. More defects in expression and transmission to the public are likely to occur if the social worker passes his opinions through the mind of a person unfamiliar with the ideals and principles of social work than if he sets them down on paper and trusts to the discretion of the editor.

A good combination is found where a person trained in newspaper work makes a close study of social work and settles down to the profession of social service publicity. Such a combination is, of course, rare, and few organizations, unless allied in some sort of a federation, can afford such trained service. In lieu of it, the best thing for a social executive to do is to prepare, or have prepared, his material in written form, even when expecting to give it to a reporter instead of to an editor. Fewer mistakes occur in this way and the editor appreciates having it in a more or less usable form, which saves him time. This does not mean that one should refuse to give reporters interviews when they come asking for them, but that all your publicity should be put in written form whenever feasible.

#### How to Write Newspaper "Copy"

HERE are suggestions for submitting material: Typewrite everything and triple space it; the combination makes your "copy" easy to read and easy to edit. Use white paper of fair quality. Leave plenty of white space at the top of your first sheet. Avoid adjectives and statements of opinion unless they are in the form of quotations from authority; a reporter is not supposed to editorialize. Put the vital part of your story first and follow with the details-a newspaper story has no climax. Make the story as short as possible, it won't have to be cut so much by the man on the "copy desk" and will have a better chance of getting in the paper. Four short stories are much more effective than one of their combined length. Do not write headlines; the newspaper has a special man to do that. Take the material to the city editor yourself, or telephone to him that you have some material which you would be glad to give to a reporter and answer questions

Other fruitful forms of publicity are letters to the editor on topics of current interest, for publication in the communication columns which most papers conduct. Letter debates sometimes are started in this way and can be worked to the advantage of the acute executive. Suggestions as to editorials on timely topics, even those not necessarily closely connected with the organization's work, are often appreciated by editorial writers. Cartoons, too, may sometimes be inspired by a friendly suggestion.

Next to consistent use of the newspaper, perhaps the most effective means of publicity is through the spoken word. Every social executive should plan several effective talks and have his staff members do the same. Lantern slides should be used whenever possible. A list of these speakers, their positions and their subjects, with notations as to illustrated talks, should be sent to all clurrches, women's clubs, civic associations, lodges and other bodies. Return envelopes and blanks for engagements desired may be enclosed. A telephone follow-up, too, is useful. Have your list of speakers and subjects published in the papers. Try to supply a speaker for every engagement requested, even if the particular speaker desired is not available. Get up a set of lantern slides on

your work and supply a suitable manuscript, so that anyone can use it. Lend it to organizations to which you cannot supply speakers. See that you have notices in the papers before filling engagements and then supply abstracts of the talks that are given. The write-up of an evening speech should be sent the papers late in the afternoon for use the following morning.

Many organizations, particularly those engaged in citywide work, are using illustrated posters. These posters, with large photographs or cartoons showing some plase of the organization's work with a relatively small amount of reading matter set in large type, will often be used for windowdisplay by stores and for conspicuous posting by churches, clubs, schools, libraries and factories. The poster should be changed every week or two so that it may retain news value.

A recent development has been the insertion of social service folders with the monthly statements of public utility companies, such as those furnishing electric light, gas or telephone service. Practically the whole householding population of a city may be reached in this way at the cost of printing the circulars.

Window exhibits, consisting of pictures, charts, models, moving objects and flashing lights, can be used as continuous publicity by showing successively in different parts of the town. Exhibits are too expensive for anything short of continuous services.

Valuable as publicity is by itself, it is most effective when coordinated with appeal for funds made through appeal letters. While many organizations are making splendid use of appeal letters, others are using expensive solicitors or depending upon volunteer efforts which are not adequate to make the circle of givers truly democratic. A good appeal letter, backed by careful publicity and sent to well selected lists, will prove profitable to the organization both in funds and in a widened circle of supporters.

The principles of good publicity apply equally well to the good appeal letter. It should secure attention, arouse interest, secure understanding, induce resolve, get action and secure the contribution. It must be simple, direct and human, and visualize the proposition. A little 'case' story will get attention and interest and illustrate the kind of work the organization does. Pictures are tremendously helpful. A descriptive folder can help bring home the story of the letter.

#### First Class Postage vs. Third

OFTEN a great saving can be made by using third-class postage. First-class postage will pay on a highly specialized list where results are certain. Letters with first-class postage should be individually typewritten or multigraphed and "matched" in with the utmost care, on good paper. But if all these pains are not taken, one might as well use third-class postage and dispense with filling in the name, or use a printed, illustrated letter which is frankly a circular. Money put into printing and attractive pictures is often found to bring better returns than if spent for two-cent stamps (three cents after November 2). In other words, if one can visualize his proposal, give it human interest, and secure favorable attention, the kind of postage and the personal fill-in make little difference when a large number of people are being approached on a general proposition.

Coordination of publicity is of the first importance. Special efforts should be made to get stories about your work in the newspapers on the days immediately before letters are mailed, and then during the days in which they are received.

Mared by Google

Other elements of publicity may be used at the same time. The publicity should use the same material which is found in the appeal letters, but it is not necessary to mention the fact that funds are being sought. Appeal letters are often most effective if the public merely has its interest aroused and is not informed that it is going to be asked for money. And the people who aren't reached by letter don't feel themselves subjected to an irritating campaign.

The "house organ" or magazine describing in an attractive way the work of a business organization, is now in great favor among advertising men. It is used to keep customers informed of the work and products of the business and to interest prospective customers. A "house organ" worked out by a social agency without the appeal element, and mailed to contributors and prospective contributors, pays good dividends in increased contributions of those renewing and in gits of those not before listed as givers. Annual reports should be prepared also from the point of view of good sales methods.

It is well for the social organization to remember in both publicity and appeals that the public likes to be cheerful. It is all right to paint unpleasant conditions as they exist, but it is important also to show the good work the organization is doing and to point out the happy results which already have been attained or will be attained if the organization is given the money to carry on the work.

The suggestions made here for social publicity and finance have all been tested. They are most effective when combined. A social executive may carry them out, or he may delegate this function to an assistant, a volunteer, a committee of volunteers, or even to a trained financial and publicity man (or woman) on an adequate salary.

The results of such methods would be greatly increased by cooperative effort among social agencies. A group of organizations which could not afford separate publicity agents could well afford to share the expense of one, who would be able to prepare material for the newspapers and arrange for the presentation of organization work in the other ways suggested. Still greater efficiency results from pooling financial endeavors as in the increasingly numerous financial federations. A city-wide sweep of organizations making a wellcoordinated appeal on behalf of all community needs is generally more effective than one organization appealing for a fraction of the needs. Objections to financial federation are many and may outweigh the advantages in particular instances. Such a federation is but the final step, however, in the development of that analogy with business methods which calls for publicity and appeals based on the same principles as successful advertising and sales, and which might well culminate in the federation as compared with the successful business combination.

Federation or no federation, these principles will greatly benefit the organization which will conscientiously follow them; will secure more funds and more cooperation; and because more efficient, either give the executive more results from the same endeavor, or while getting the same results, give him more time for the social work of his organization.

# The Soldiers' and Sailors' Insurance Law

HEN the conferees of Senate and House reached final agreement last week on the soldiers' and sailors' insurance bill, they determined the degree of generosity of the United States toward those who are to fight its battles in the present war, and toward their families. The bill, which now needs only the signature of the President to make it law, was widely discussed as it traveled through the two branches of Congress and was generally approved for its liberality. The final form reduces the compensation for death and disability, but retains substantially unchanged the provisions respecting insurance and allowances to the families of enlisted men.<sup>3</sup>

The law first takes up the subject of allotments and family allowances. As in the original draft, the enlisted man is compelled to allot to his family not more than half his pay (the pay of an army private is \$33 a month), nor less than \$15. The wife of the man may waive the compulsory allotment upon producing satisfactory evidence of her ability to support herself and children, and exemption may be granted also "for good cause shown," such as the infidelity of the wife. In addition to the compulsory allotment to his immediate family, the enlisted man may allot further portions of his pay to any person he may designate, subject to the regulations of the War and Navy Departments.

The monthly allowance to be paid by the government to the immediate family of the enlisted man is the same as in the original bill:

Wife without children\$1
Wife and one child 25
Wife and two children
For each additional child
No wife, but one child
No wife, but two children
No wife, but three children
No wife, but four children
For each additional child

This was declared by Porter R. Lee in the SURVEY to be a generous provision. The schedule of monthly allowances to be paid by the government to other persons specified by the enlisted man, provided these persons are wholly or partly dependent upon him. is as follows:

One	parent					 	\$10.00
Two	parents		• • •			 	20.00
Each	grandchild,	brother	01	31340	F	 	. 5.00

The maximum allowance to the dependents of any one enlisted man is \$50 a month. The law departs from its original form in declaring that no allowance shall be made for any period preceding November 1, 1917. The allowance is to continue till death or one month after discharge, but not for more than one month after the end of the "present war emergency." The term "child" in the act includes an illegitimate child, if acknowledged by the father, but does not include such a child if born outside of the United States or its insular possessions after 1917. This definition applies to both the insurance and compensation sections.

The law deals next with compensation for death or disability. This section applies to nurses in active service under the War and Navy Departments, as well as to enlisted men. The House increased the monthly amounts allowed in case of

<sup>&</sup>lt;sup>1</sup> The provisions and progress of this act bare been discussed in detail in the Suxvi. The original form was analyzed in the issue of August 18, page surrance features. Porter R. Lee discussed the allowances for dependent families in the issue of September 15, and J. M. Rubinow discussed the compensation provisions in the issue of September 15.

death, but the final form of the law makes these even lower than in the original bill. They now stand:

For a widow alone	25.00
For a widow and one child	35.00
For a widow and two children	47.50
For each additional child up to two	5.00
No widow, but one child	20.00
No widow, but two children	30.00
No widow, but three children	40.00
Each additional child up to two	5.00
For a widowed mother	20.00

The amount payable to a widowed mother shall not be greater than a sum which, when added to the total amount

payable to the widow and children, does not exceed \$75.

The monthly compensation for total disability is reduced to the following:

\$30.0
45.0
55.0
75.0
40.0
ing 10.0

To the provision which granted \$100 a month to a man for the loss of both feet, both hands, both eyes or total blindness, the final form of the law adds "or helplessly and permanently bedridden." This applies regardless of whether a man is a bachelor or married.

If the enlisted man's disability is partial, the monthly compensation is to be a percentage of the compensation that would be payable for his total disability, equal to the degree of the reduction in carning capacity resulting from the disability. No compensation shall be payable, however, for a reduction in earning capacity rated at less than 10 per cent. The burreau created to administer the act is to adopt a schedule or reductions in earning capacity. This schedule is to be based, as far as practicable, upon the average impairments of earning capacity resulting from such injuries in civil occupations and not upon the impairment in earning capacity in each individual case, so that there can be no reduction in the rate compensation for individual success in overcoming the handicap of a permanent injury. The bureau is directed to readiust its schedule in accordance with actual experience.

Proof of marriage for the purposes of receiving both compensation and insurance under the law is made similar to that required by the pension bureau. One stipulation is that the open and notorious illicit cohabitation of the widow termi-

nates her right to both. The wife who marries an injured man more than ten years after his injury gets no compensation after his death.

The elimination of all distinction between officers and men so far as disability and death benefits are concerned is retained in the final form. On the other hand, permission to commute for a lump sum all or part of one's compensation payments is stricken out. A five-year statute of limitations (instead of ten years as the House proposed and two years as the original bill proposed by part of the law.

The insurance feature of the measure aroused perhaps the most vigorous opposition. This also applies to nurses. The United States is to grant insurance against the death or total permanent disability of an enlisted man or nurse in any multiple of \$500, but not less than \$1,000 or more than \$10,000. This maximum was reduced in course of passage to \$5,000, but was raised in final form. The insurance is payable only to the beneficiaries specified in the measure, namely, spouse, child, grandchild, parent, brother, sister, and during total and permanent disability to the injured person, or to any or all of them.

The insurance must be applied for within 120 days after enlistment, or, for those already in active service, within 120 days after the publication of the terms of the insurance contract, which must be "promptly" on the passage of the act. If a person entitled to apply dies or is totally and permanently disabled within the 120 days, without having made his application, he is deemed to have applied. The insurance is made expressly payable in 240 equal monthly installments, but these will be continued for the life of a disabled man and may. under regulations, be converted into continuous installments for a beneficiary. Premium rates shall be the net rates based upon the American Experience Table of Mortality. Payments of premiums may not be required in advance for periods of more than one month each and may be deducted from the pay or deposit of the insured or be otherwise made at his election.

By a rider to the law all present pensions to widows are increased to \$25 a month.

The passage of this act represents an important step in the social-insurance movement in this country. The act was drafted by Judge Julian W. Mack, and was introduced into the House and Senate August 10. It has had the active suport of President Wilson, Secretary of the Treasury McAdoo, Julia C. Lathrop, chief of the Children's Bureau, Henry P. Davison, chairman of the Red Cross War Council. and others.

# THE RED CROSS

By O. R. Howard Thomson

I SAW the golden gates roll back As up the path they came; No angel questioned them of sin, Nor asked of one his name: But the cedar trees before the mount Were aureoled in flame.

They came from barren, war-flailed fields, From which all life had fied, And little phrases walked with them— Words they aforetime said— That dying men might easier pass To the valleys of the dead. And following close, from low-pitched tents, Moved, like a genile breeze That brings the seen to f a garden close To the temples of the trees, Blessings of those whose bodies lay Now healing at their ease.

And songs of children who had learned The Red Cross knows not fear; That it walketh through a man-made hell Yet holdeth each man dear; Daring the steel-sheathed claws of death To wipe away a tear.

Therefore, they entered as of right— Agnostic, Christian, Jew— Through the Golden gates that gave upon The lake where the lilies grew; And in the distance by the mount, Angels on trumpets blew.

CHINESE CABSTAND: THERE ARE 25,000 JUNEIKISHA PULLERS IN PEKING ALONE

# China's Social Challenge

## II. Beginnings of Social Investigation

By J. S. Burgess

HE Chinese seldom describe anything at length without a copious use of that aid to inaccurate expression
"Cha-pu-to," or "differing not a great deal from"—
their way of saying "about." There is a notable
lack of precise phrasing in the colloquial because the thought
back of the phrasing is inaccurate.

Absence of the habit of careful analysis and inductive study of fact, especially of social phenomena, is very apparent. The one great exception is found in the conversation among the lower classes regarding money. The struggle for the necessities of life requires an extreme nicety in exact estimate of expense and income. The rise by a fraction of a cent in the market price of peanuts or rice will at once be known far and wide and will start great numbers of wheelbarrows on fiftymile pilgrimages.

The scientific study of social facts is as yet in its infancy. In Peking I have heard a noted American college president, then an adviser to the Chinese government, discussing with a group of Chinese who had degrees from western universities whether there really was much surplus wealth in China. No one seemed to know. It is impossible to guess what the per

capita wealth is and no one knows how many millions are hoarded up by the old Manchu nobility or by the Chinese officials.

Such a question as why so many Chinese, in spite of the fact that they are by temperament hard-working and frugal, are miserably poor, and the question of just how poor they are, are problems that have to be guessed about, for little real study has been made. Bishop Bashford's recent work, China—An Interpretation, has much valuable observation ing and valuable themes of important social study which China presents. In the realm of social origins little has been done in an intensive way. One massive book on descriptive sociology of the Chinese was prepared many years ago by an ardent Spencerian. It is a mass of heterogeneous facts representing not much more than an outline of subjects to be studied.

A few years ago Philip Gillett, the Y. M. C. A. secretary in Scoul, Korea, collected a lot of valuable information on

but few tabulated statistics are available on any subject.

One is struck by the large number of extremely interest-

A few years ago Philip Gillett, the Y. M. C. A secretary in Scoul, Korea, collected a lot of valuable information on guild organization. A large number of ancient constitutions of these organizations, some of the documents dating back three thousand years, was obtained. A wealth of information on various phases of primitive village organization was discovered which threw light on such themes as, the approach to representative government in early Korean clan life, the primitive place of religion in its relation to government and trade, early industrial organizations and conditions of labor, primitive methods of preventing fire and primitive methods of afforestation. The old documents of one of these guilds of afforestation.

were in a locked box opened once yearly. To this were attached three padlocks, a different man holding each key. The box in this way could be opened only when all three men met. Mr. Gilbert got permission for a number of Korean scholars to be present when the box was opened and to copy as many of the ancient manuscripts therein contained as possible. He found that these ancient Korean guilds all copied their constitutions from still earlier and as yet unstudied Chinese guilds.

<sup>1</sup> Mr. Burgess' first article, An Opportunity for American Social Workers, was published in the Suavey for September 8. His next one will be on Social Institutions, Old and New

COURTYARD OF JINEKKISHA COOLIES' HOUSES

One-room houses close in the courtyard on all sides. At the left of the speture is a cooperative summer kitchen.
Fully one-third of the coolies have no homes at all but sleep in the jinrikisha yards

Here is a rich field for a social scholar who has confined his observations to social origins in Europe. In fact most of the works on sociology ignore at least one-half of the human race in conclusions regarding the early field of social discovery.

But one need not go back three thousand years to find unexplored social problems in China, especially in a great oriental city like Peking, where so little scientific study of

None of the coolies own their own vehicles but hire them al rentals which net the owners 100 per cent a year on their investment

life has been made. Gay pictures of the beauty of oriental life, or repulsive descriptions of the squalor of the East, often leave one in ignorance as to the real social forces and underlying needs.

Just across the street from where I first lived in Peking was a so-called "home" of a jinrikisha coolie. This house was built of mud, one story high, with one door and no windows. Three generations occupied this small dwelling, grandfather and grandmother, the coolie and his wife, and two or three children. Occasionally I used the coolie's uncomfortable jinrikisha, largely through pity for his condition. The year after I had moved my home to another part of the city a caller was announced one day, and my friend, the jinrikisha man, walked in. He had around his head a piece of white cloth, which indicated that one of his parents had died. He had lost his father a few days before and he was trying to borrow a little money to buy a coffin. It had been raining heavily and the roof of his house had fallen in. The unburied body was still lying in his roofless house, the children were terribly frightened and he did not know what to do.

It was for the purpose of getting at the actual conditions of this class of working men that one spring day in 1912 four Chinese college students and one young American met together in an old Chinese court on a side alley off one of the main streets of China's capital. The aged gateman was sent through the mud to the well macadamized main street and told to summon the first rikisha coolie that he could find. Eager for trade the coolie quickly responded, dragging his rikisha behind him. To his utter astonishment he was politely asked to be seated and offered a cup of Chinese tea.

Then a youthful investigator started plying him with questions. How much did he pay for his rikisha? Where did he get it? How much did he earn a day? Where did he

live? How many were in his family? How had his health been during the last few years? What illnesses had he had? Could he read, and if so, how much? What were his religious beliefs? The coolie was utterly astonished at these questions, for when in the history of the celestial empire had a group of young scholars been interested in the habits and needs of a poor uneducated coolie!

The replies were prompt and apparently truthful. The plan was such a new one that there was no time to devise cunning answers, nor did there seem to be any reason to do so. After twenty minutes of careful questioning, the first coolie was given a copper and sent out and the old gate-keeper trudged once more through the mud to search for another bare-armed and bare-legged specimen to answer the questions. With each newcomer the little group became more interested. They gradually began to see that there was some sense in the ideas of the foreigner when he had told them that they should apply their scientific research to men and society, as well as to birds and stones. There came the realization that for the first time in the history of that great capital the actual facts about the lives of a great laboring class were piens studied and tabulated.

And the revelations which these coolies made were by no means commonplace. Startling revelations of poverty and degradation were matched by hopeful discoveries regarding the education and technical knowledge of many of a class here tofore considered to be quite hopeless. The conditions of living which were described by these coolies were such as no beggar in America could possibly endure. In some cases four or five lived in one little mud room, in others the coolie had no home at all, but slept in the street, or in his rikisha, or with thirty or forty other men in the crowded court where

he rented his rikisha. On the other hand, the students were astonished to find out that almost half of the twenty-seven coolies studied could read. Some of them had read the classics through, and showed it in their conversation.

One man, about sixty-five years old, when he came into the room, surprised us greatly by his courtesy. He was one

STREET RESTAURANT

The coolie eats when he gets a chance, dropping in at a street restaurant for a bowl of cabbage soup and a piece of bread

of the most dilapidated specimens of humanity that I have seen. His clothes were literally all rags, but he stood erect and refused to take the chair which we offered him. He spoke with a perfect Pekinese accent, and with the best choice of language. To our astonishment he told us that he had read all the classics through. The story of how he came to be in his present condition he did not reveal to us. At the close of our conversation he refused to take the money which we offered him, although his earnings were only one or two cents a day, and when we insisted he said: "But, gentlemen, how could I take money from you who are spending your time in order to help the class of men of which I am one? We should repay you, but you have no obligation to repay us."

A brief report of this first investigation was made out and this was the beginning of the interest in several parts of China in the jinrikisha coolie—one of the biggest classes of laboring men in that great nation.

A public-spirited citizen of the foreign settlement in Shanghai happened to see this report and was aroused to the needs of the men who pulled him around the street every day. Through his efforts and the investigation that resulted, many warm booths were built, rude shelters at certain places along the main streets where, during the cold winter months, the coolie could get hot tea. One mission in Shanghai has a special clubbouse for the assistance and also the evangelization of

the jinrikisha coolie.

During the winter of 1914-15, the Peking Students' Social Service Club, a few of whose members had made the first investigation of the coolie, determined to make a scientific study of the problem. The club had grown from thirty college students to six hundred, and several score of these young men were eager for the new enterprise. Three hundred and two coolies were put to a rigorous questionnaire. These were selected from every part of the city. The results were compiled and tabulated with great care by Professor Tao of the chair of sociology in the Government University, a disciple of the Webbs of London. He found a wealth of information in the data faithfully collected by these students.

After a study of the facts, Dr. Tao ruthlessly condemns the entire system of man-pallers as detrimental to both the individual and society. The work is characterized as: "(1) Over-strenuous and unconomical because the jinrikisha man can carry only one at a time, and that with all his energy; (2) the work is unhealthy because it is over-strenuous, hinders development of the chest, causes tuberculosis, pneumonia and other diseases; (3) the pay is terribly meager in comparison with the terrific energy expended; (4) scarcely any intelligence is required for the work;

Dr. Tao has also shown by careful figuring that the use of the jinrikisha is very uneconomical. The average amount of money for transportation about New York or London is shown to be less per month than one would spend on a jinrikisha man in spite of his low pay.

Over twenty thousand jinrikisla coolies are registered at the Metropolitan Police Office of Peking. Of the 302 examined by the Peking students most were between 20 and 30 years of age, with a few boys of 16 or 17 among them. There was no legislation to prevent the young or the very old from engaging in this business. About half of the 302 were married. Contrary to the usual large size of the Chinese family, somewhat less than one-half had only three dependents to look after. About one hundred of them had large families to support.

The great majority of the coolies investigated earned from 51 to 80 coppers a day, and the rent of the jinrikisha is from 21 to 40 coppers a day. The net wage then would be from 30 to 40 coppers a day. The copper is less than one-half of an American cent.

The study of the cost of living of these families revealed that a single person can live on from 15 to 20 coppers a day, and that a family of three can exist on 25 to 40 coppers a day. A family of four, Dr. Tao says, "must have an income of 00 coppers to get adequate food." It is furthermore true that the jinrikisha coolie himself, if he is not to drop on the roadside from physical exhaustion (a sight, by the way, which I have often seen), must have more nourishing and expensive food than is necessary for the other members of the family.

Since it is further true that the older men with the larger families have often the smaller income, it is obvious that while a few of the younger unmarried men may be able to put aside some money, a majority not only cannot save but are on the verge of starvation. Dr. Tao remarks: "Rough estimate has suggested that only one-fifth of the jinrikisha population is really earnest in saving money for any length of time." Can you wonder?

The above facts are more striking when it is realized that none of the jinrikisha coolies investigated owned their own vehicles and that a comparison of average rentals and average cost of a jinrikisha reveals the fact that the owners make a profit on their investment of from 100 per cent up. Here we obviously have industrial slavery in one of the very worst forms,

More than one-half of these men work—that is, run from seven to ten hours a day, and one-lifth of them from twelve to fifteen hours a day. This, of course, does not mean that they are running continuously, but many of them are exercising a good part of the time.

More than two-thirds of those examined had been in the trade from one to four years. "It seems," Dr. Tao remarks, "that from the figures may safely be drawn the inference that the usual number of years during which a jiarikisha man can stand the hard toil is generally from three to four. This gives rise to his subsequent career. If deprived of savings, and without any trade, the only way open to him is to become a parasite on the commanity or be starved.

The investigations showed that over half of these coolies had been artizans or petty merchants. It is obvious, therefore, that they are not a hopelessly untrained group.

The amusements, vices, religious beliefs and habits of thought and life of the coolies were brought out—in fact, it would take a lengthy series of articles adequately to tell of the new material discovered by the students and tabulated by Dr. Tao.

On the basis of the investigations a practical program for the betterment of this entire class of jinrikisha men was proposed by Dr. Tao. His plans included a clubhouse for their social and educational use, laws regulating hours, age, rentals and a scheme of insurance to help them save.

The jinrikisha coolies represent only one isolated problem; there are a hundred other trades of which we know nothing. Nor are we any better informed of the growing problem of immorality, of licensed prostitution becoming more of a menace each year, or of the related problems of amusement and recreation. The coming of the new industrial age in China brings with it a whole set of new questions which call for the insight and appreciation of trained social workers. Have social thinkers in America no contribution to make to the study of social facts in China which must precede any real social progress?

## Book Reviews

MEDIATION, INVESTIGATION AND ARRITRATION IN INDUSTRIAL DISPUTES

By George E. Barnett & David A. Mc-Cabe. D. Appleton & Company. 209 pp. Price \$1.25; by mail of the Survey \$1.33. Of ever increasing

The Machinery for Making Peace

importance in the general social and labor field, particularly during the present war crisis, is the subject discussed in this monograph of Professors Barnett and McCabe. The book is largely the result of the investigation conducted by the authors for the United States Commis-

United States Commission on Industrial Relations. Briefly it aims to portray the workings of the present statutes relating to mediation, investigation and arbitration in labor disputes in the states of Massachusetts, New York and Ohio; to propose a model plan for a state system, based on the authors' findings in the states investigated, and to outline a scheme for national legislation. The book also con-

tains important appendices.

The conclusions of the authors are of interest. Of the three forms of state assistance in settling disputes, mediation has proved most effective. Mediators have frequently been instrumental in bringing reluctant parties to agree to conferences and in getting the parties separately to agree to compro-mises which they would not even discuss with each other. Scant results have been obtained, however, when the employer had resolved not to deal with the workers as a body, either directly or indirectly.

In New York and Massachusetts, on

failure of mediation, resort has been made to public investigation and recommendation. In making recommendations, which generally receive considerable publicity, there is little attempt to fix blame on either party. It is encouraging to learn that in most eases the suggestions of the mediators have been accepted as a basis for settlement.

Boards in these two states bave also power to arbitrase eases voluntarily submitted to them by both sides, providing submission does not take place during a strike or lockout. In 1913, approximately eighty cases were submitted to the Massachusetts board in the shoe industry. Following the rendering of a decision, an endeavor is made to induce parties to the dispute to agree to submit mooted points to the court in the future. In New York, arbitration bas been resorted to in but few instances.

Following their analysis of past achieve ments, the authors make important detailed recommendations concerning the composition and functions of state and national boards. They urge the establishment of boards of mediation, investigation and arbitration in every state. The nation, as well, they contend, should provide for such boards, as at the present time the Erdman law extends only to certain classes of railroad disputes, and mediation in controversies in other fields is possible only through the officers of the Department of Labor.

In cases of threatened disturbances in connection with transportation and other public utilities, where it is important that services should be continuous, the authors believe that pressure should be made on both parties to refrain from hostilities until the board of mediation and investigation has made its report. Where the public has confidence in the board, their recommendations should serve as a rallying point for public opinion. Experience in Australasia and in Canada has not demonstrated that legal prohibitions would be more effective in preventing interruptions.

Perhaps the most unique of the authors' recommendations is the appointment of a na-tional industrial council composed of an equal number of representatives of employers' and labor organizations, which should be convened at least once a year and should assist in the selection of members of boards of arbitration and mediation in certain dis-

The classifications in the book are admirably arranged, and its conclusions and recommendations are clearly set forth. It is somewhat unfortunate, however, that a book dealing with such an important problem does dealing with such an important problem does not contain more vitality. The authors coldly set forth results. They have injected in it little of human interest. They have given but a scant idea of the way in which capital and labor, organized and unorganized, regard the activities of the various boards or the effect of such activities on the militancy or strength of labor organizations and on their struggle for an ever greater share of the social product.

Nor is the reader made to realize the intimate connection of the problem discussed with the happiness and welfare of the thousands of working class lives. It is not a book calculated to stir the erusader's ardor. However, there is doubtless a certain compensating gain in this very faet and, on the whole, the monograph is to be heartily recommended to everyone interested in social readjustments for its careful analysis and its timely suggestions.

HARRY W. LAIDLER.

ORGANIZABILITY OF LABOR By William O. Weyforth. Johns Hopkins Press. 277 pp. Price \$1.50; by mail of the Survey \$1.61.

To what extent can labor in America be organized? This question, upon which so much difference of opinion exists, has been

most carefully studied and analyzed by Mr. Weyforth. The book contains internal evi-dence of a studious and successful effort to indicate the influence of the more promi-nent factors and to point out the conclusions which are justified from the experiences encountered by the wage-earners in our Ameri-can industries. The obstaeles which these workers are forced to contend with in their efforts to organize are clearly presented, and the methods and agencies adopted by them to overcome these forces are described.

The factors presented by the internal management of the trade union, the characteristics of particular groups of workmen, the nature and form of the industrial organization, the degree of skill required by the various groups of workers, and the general economie life of the country are effectively analyzed and summarized.

Through a liberal use of illustrations taken from the history of the trade unions and the associations of employers dealing with, or influencing them, the author has succeeded in supplying a clear and direct view of the major forces in operation for or against organization.

Mr. Weyforsh's book contains a most valuable summary of the present-day knowl-edge upon the problem, and supplies a fund of information which constitutes a valuable contribution to the literature dealing with economic and industrial problems.

JOHN P. FREY.

STANDARDS OF AMERICAN LEGISLATION

By Ernst Freund. The University of Chicago Press. 327 pp. Price \$1.50; by mail of the SURVEY \$1.66.

The thesis of this book by Professor Freund is that a system of positive principles should be developed to guide the making of statutes, quite distinct from the doctrines of constitutional law which the courts apply when they review legislation. By "positive principles of legislation" are meant settled policies whose soundness is recognized by all reasonable persons, though unfortunately they may be disregarded in the heat and partisanship of legislative contests.

tisanship of legislative contests.

The doctrines by which the courts test the constitutionality of statutes are not principles of legislation in this sense. "Due process of law," upon which reliance has chiefly been placed when statutes have been invalidated, represents a debated policy rather courts unaided be expected to develop satis-factory principles of legislation. Their function is to guard individual rights; whereas legislation must consciously favor social over particular interests. The courts move in an atmosphere of controversy; while the spirit of legislation is that of compromise.

The task of formulating positive principles of legislation Professor Freund regards as peculiarly that of the law schools. When formulated, some of these principles should be enforced by the courts, but many of them will represent ideals rather than essentials. Such principles must find expression through the legislatures; and they will become effective only as legislative practices are altered to insure more carefully drafted bills and more thoroughly considered laws.

A number of principles of legislation are suggested by Professor Freund to illustrate the possibility of standards superior to the vague generalities found in many court de-The correlation of legislative procisions. cisions. The correlation of legislative pro-visions, for instance, is such a fundamental principle, which when ignored will produce failure of policy. But Professor Freund does not aim to state comprehensively the principles of legislation. He recognizes that this is a task demanding the attention of the best students of jurisprudence and most painstaking researches in legislative, judicial and administrative experiences.

This book is intended primarily for scholars; it is, as stated in the introduction, "an essay of constructive criticism." It stimulates thought and suggests further studies. It is a work which jurists and constitutional lawyers will read with profit; however, it will also interest the layman who appreciates the increasing importance of statute law. EDWIN E. WITTE.

WORKMEN'S COMPENSATION
By J. E. Rhodes. The Macmillan Com-pany. 300 pp. Price \$1.50; by mail of the SURVEY \$1.60.

Mr. Rhodes has filled a timely need by bringing together in a historical sketch the threads of compensation development in this country. However, in valuing his discussion of state and stock company insurance, the author's insurance connections must be borne in mind. To assume, as he does, that "the opposition to compensation insurance in stock companies may be reduced to two general specifications": alleged excessive profits and alleged practices in adjustment of claims, is to side-step an important issue.

Criticism of stock company insurance has been directed not so much against "excessive profits" as such, as against excessive expense ratios. In a footnote the author admits an expense ratio under liability insurance of 55 per cent, made up of 25 per cent for agents' commissions, 15 per cent for home office expensea and 15 per cent for adjustment and legal expense. While it is true that under workmen's compensation, stock companies 40 per cent, nevertheless state insurance funds claim to have still further reduced expense ratios to 10 or 20 per cent.

In passing, two additional points may be First, the author's statement that compensation is for the purpose of preventing want and "is in no sense the monetary tained" is open to serious question. To hold thus would place workmen's compensation on a par with poor relief. Second, doubtful whether anyone unfamiliar with the organization of the New York Industrial Commission could possibly gain a correct picture from the description given.

Perhaps the most interesting contribution remaps the most interesting contribution is the author's classification of all laws re-lating to safety and health of employes as "employers' liability" legislation on the ground that such legislation supplements and defines that general principle of common law which requires an employer to furnish a "safe and suitable place" in which to work if he would escape liability for damages in case of lajury to an employe.

IRENE SYLVESTER.

MUNICIPAL OWNERSHIP

By Carl D. Thompson. B. W. Huebsch. 114 pp. Price \$1; by mail of the SURVEY \$1.10.

MUNICIPAL FUNCTIONS By Harlean James. D. Appleton & Co.

369 pp. Price \$2; by mail of the SURVEY \$2.20.

Mr. Thompson gives us a frankly one sided presentation—the case for municipal ownership. His book is almost in the nature of a brief and will serve well as such for those who accept the point of view. It is developed around the theory that public service is a necessity, the chief interest of the public is served by good service and low

charges, the chief interest of public-service corporations is served by poor service and high charges, and that, therefore, the in-terests of the public and of the corporations are incompatible. Municipal ownership has proven efficient and economical, and private service has proven the opposite. There is only one reason why municipal ownership does not prevail, and that is that publicservice corporations have more influence over the politicians than have the people who put them into office.

Professor James has done a service to municipal government by writing a book which is interesting and constructive. Though which is interesting and constructive. I nough perhaps not directly intended as a text-book, it has the special values of being funda-mental and clear, so much required and so seldom found in text-books. For the beginner who would acquire the point of view of the municipal statesman there is probably nothing better. Such controversial questions as municipal ownership are discussed with a commendable impartiality-but the discussion

is genuine.

There is one disappointment in the book. The reader is left with the impression that the housing problem cannot be solved. Housing codes do not provide a solution because they put living quarters beyond the reach of the poor. Municipal housing seems not sound, though it is evidently more economical for a city to house at a loss those displaced by codes than to support them out-"Fundamental change in industrial and labor conditions" will come nearer a solution. Just what does this mean? If, as in the last line on page 214, the unearned increment belongs to the public, why not apply it to the solution of the housing problem? Taking the unearned increment would relieve direct taxes on the earnings of the people, would make it unnecessary to fine a man for building a home, would bring land into use, increase wages, lower the cost of living—in short, it would solve the housing problem.

With these points brought out in a postscript, the volume offers just what the know.

EDWARD T. HARTMAN.

OUR AMERICA

By John A. Lapp. Bobbs, Merrill Company. 399 pp. Price \$1.25; by mail of the Survey \$1.35. Among the many text-books on the ele-

ments of civics, this work by Mr. Lapp standa out as one of the clearest, the most logically arranged and the most helpful for the average student of civics in or out of school. The book is entirely free from statistica and cites only a few "examples." It is a simple, clear descriptive analysis of the needs of the people met by their governments, and the processes by which government serves the people. Instead of taking up, as do most texts, the federal, state and local gov-ernments separately, Mr. Lapp deals with the services and processes as the primary factors, describing under each what the federal, state and city governments do. That

method of treatment thus harmonizes all activities of government, leaving a clear rather than the usual confused picture in

the mind of the student.
At the end of each chapter there are suggestions for further reading and investigagestions for further reading and investiga-tion. The chapters are divided into subject paragraphs. There is a helpful appendix with an outline of the powers of federal, state and local officials, together with the Declaration of Independence and the Con-Valuable suggestions where to write for further information are furnished throughout the book. A simple, well-edited bibliography on the leading topics is in-cluded. The book throughout is carefully

written with every facility for easy use. Mr. Lapp brings progressive ideas to the front, emphasizing at all points the actual services of democratic government to the people, rather than forms or

theories.

ROCER N. BALDWIN.

TOWN PLANNING FOR SMALL COMMUNITIES By Charles S. Bird, Jr. National Mu-nicipal League Series. D. Appleton & Co.

492 pp. Price \$2; by mail of the SURVEY \$2.20

Ten years ago a book of this kind would have created a sensation. But the social considerations in the planning of a small city, first outlined by Prof. Patrick Geddes in his memorable report on Dunfermline, have almost become commonplace now. The questions of interest in reviewing such a report no longer are. Does the author relate his plan to the various social needs of the community? but, How does he thus re-

The Walpole Town Planning Committee, in trying to meet its own problems, has made a thorough study of the planning and administration of small communities generally; and the book under review contains the results of that study as well as the report proper. While the project contains many items which may appear ambitious, including a considerable park and town forest area, street widenings, park ways and civic center, the optimism of the committee seems justified by the excellent improvements which have already been accomplished or are under way. Among these improvements are not way. Among tuese improvements are monly the physical alterations of the town plan, based upon the recommendations of John Nolen, but also the creation of community organizations and permeation of the community with progressive and cooperative aims which, apparently, have borne fruit already in a vitalized social life and heightened sense of responsibility,

IOWA APPLIED HISTORY SERIES, VOLUME III By Briggs, Shambaugh, Patton and othera. State Historical Society of Iowa. 718 pp. Price \$3: by mail of the Survey, \$3.24.

"Henceforth no candidate for the legislature in Iowa may have his name printed on either primary or regular election ballot until he has creditably passed an examination on Applied History, Vol. I (1912), Vol. II (1914) and Vol. III (1916)," No. this is not true yet, but if it were so ordered, Iowa's legislature would soon be nationfamed for intelligence, economy and effi-ciency. Volumes I and II of the Iowa Applied History Series have been previously reviewed in this column, in which "applied history" was defined as "the use of the scien-tific knowledge of history and experience in efforts to solve present problems of human betterment," or, in brief, an effort to harness history for social service. Its process in-cludes impartial investigation, scientific interpretation, expert definition and application of standards

The third volume, Statute Law Making in Iowa, adds further laurels to the enter-prising editor, Benjamin F. Shambaugh. An enormous amount of labor was manifeatly involved as the mere preliminary tasks called for research indexing of 97,000 pages of house journals and volumes of statutes, consideration of the bills and resolutions introduced into the General Assembly, of which there were 29,500 between 1846 and 1916, and threading the maze of legislative proceedings, rules, usages, precedents and orders with judicial interpretations and conatructions.

Necessarily much of the work is descriptive and technical to a degree that would almost defy the possibility of being inter-esting, to say nothing of being popular, since the general subjects are the history and organization of the legislature, its law-making powers, methods of statute law-making: powers, methods or statute form and language, codification, interpreta-tion and construction and drafting of stat-tes and the committee system. However, the various writers have succeeded surprisingly not only in making a complete and succinct summary of all vital information on these subjects, a legislative wade mecum, but also in setting them forth in readable articles. The last section, on Some Ahuses articles. The last section, on Some Ahuses Connected with Statute Law-Making, gives opportunity, of course, for a much more popular and interesting discussion than the historical and technical sections, though the latter in many places are skilfully illuminated by incidents and interpretations.

Much less readable and interesting than the first two volumes, because of the differ-ence in subject matter, Volume III is, nevertheless, an invaluable contribution to the state of Iowa, and worthy of emulation by

C. W. FLINT.

CRIMINAL SOCIOLOGY (Vol. IX of Modern

Criminal Science Series) By Enrico Ferri. Little, Brown and Com-pany. 577 pp. Price \$5; by mail of the SURVEY \$5.30.

One of the most valuable volumes in a useful series, which has already given to an English-speaking public important works of de Quiròs, Gross, Lombroso, Saleilles, Tarde, Aschaffenburg, Garofalo and Bonger, is the one which has just appeared, the first com-

plete translation into English of Ferri's Criminal Sociology. Among criminological studies, Ferri's work has especial significance for its hreadth of view. As a pupil of Lombroso, he is in no danger of forgetting or minimizing the biological factor in the causation of crime; as a disciple of Marx, be lays emphasis upon the social and economic causes which the biologist is inclined to overlook, and he clears up one persistent tangle by pointing out over and over again that to account for the emergence of crime we do not have to choose among the factors involved for the one responsible for the effect, because all work together to produce it. As he puts it, it is as absurd to ask whether the anthropological factors are more effective than the physical or social factors, as to ask whether air or heart contributed most to the life of a mammal, since if one or the other fails, the combined effect disappears."

Ferri's classification of criminals appears to us now somewhat overlapping and difficult to establish in given cases by practicable tests. But it was a distinct step in advance when presented, and afforded a basis for

when presented, and arroted a doass for the better working out of types and tests. Of particular interest is bis full discussion of the treatment of crime. Experience is cer-tainly justifying his fundamental principle of treatment—social defense—as the one which works out the most satisfactory results in the greatest variety of cases.

The translation is satisfactory, although not so readable as the French translation of 1905, from which it was made. But why
use "data" as a singular noun? Reference
to any English dictionary shows that muchmiaused word docketed as "n.pl."

KATE HOLLADAY CLACHORN.

PSALMS OF THE SOCIAL LIFE

By Cleland B. McAfee. Association Press. 187 pp. Price \$.60; by mail of the SUR-VEY, \$.64.

Most readers of the Psalms will wonder why these most personal writings in the Bible in which "I," "me," "my" and "mine" occur many times more often than anywhere else in scripture, should be called Psalms of the Social Life. Students of the social teachings of the Bible have always been puzzled to account for the intense individualism of the paalmists, in view of the fact that their contemporaries in the historical and pro-phetic literature were so corporate in their consciousness and so collective in their action that they scarcely recognized the individual as having status or rights apart from the group with which they identify him. points of view is suggested in the author's assumption that each psalmist had this same consciousness of himself as only one of the

chosen people. But whether this social spirit is brought out of the Psalms or read into many of them may be open to question. In either event, however, an interpretation is given to their most individual expressions which invests them with new interest and significance to the socially minded, and which yet leaves them as expressive as ever of each soul's

them as expressive as ever or each soul's innermost depths and heights. Perhaps only an interpreter who shares the present-day religious social consciousness could have thought of balancing, as this one does, the individual and collective expressions, the personal and national hearings, the particular and general statements of the Psalms. In a new and fresh way, with both scholarship and vision, Professor McAfee relates the self with and against and for the social group, and the group with the social order, and the social order with praise, prayer and the forecast of faith, identifying each with the other not only as they appear in these "psalms of a thousand years, as they are linked at the present, both in each individual experience and in the life of all

G. T.

THE JAPANESE CRISIS

By James A. B. Scherer. Frederick A. Stokes Company. 148 pp. Price \$.75; by mail of the Suavey \$.83. THE JAPANESE INVASION

By Jesse Frederick Steiner. A. C. Mc-Clurg & Company. 231 pp. Price \$1.25; by mail of the SURVEY \$1.35.

THE MENACE OF JAPAN
By Frederick McCormick. Little, Brown &

Company. 372 pp. Price \$2; by mail of the Survey \$2.14.

"Crisis," "invasion," "menace"—the very titles suggest the frame of mind in which Americans present view our relations with our neighbor across the Pacific. President Scherer's unpretending, but sane, informed and schol-arly little book represents the viewpoint of that large body of in-

telligent Americans who recognize without panic the existence of at least one real ques-tion at issue between Japan and the United States, a question capable of heing mis-handled so as to lead us into war, or of being handled with intelligence and considerateness so as to lead to a peaceful and mutually satisfactory solution.

President Scherer finds the essence of the problem to be economic, a question of competition of standards of living on the land. Dr. Steiner, on the other band, is confident that the real question is at bottom racial: while Mr. McCormick belongs to that too numerous school of western journalists who have watched the sinuosities of far-eastern diplomacy so long that they cannot see, or apparently indeed desire, any way out of the perplexities of the Chinese situation but hy a good healthy war with Japan.

President Scherer is a trained scientist who has lived five years in Japan and seven in California, and who has had long familiarity California, and who has nad long ramminatry with our race problems in the South. His judgment, therefore, comes with rare authority, for it is that of a man who knows what he is talking about. He is eminently fair to the Japanese—and to the Californians likewise. To the question, Is Japan militant? he returns a quiet and sensible qualified neg-ative. A high-spirited and sensitive people, responding generously to just and kindly treatment, the Japanese are subject none the less to outhursts of popular wrath when their feelings are stirred, and even their cool-beaded government has more than once been driven into war thereby. "The danger of some sensitive popular explosion is the only menace to our peace with Japan" (page 59). As for the vexed question of assimilation; the Japanese "may be spiritually assimilated to our manners of thought and action, so as to make good citizens," but in view of the intense feeling aroused by racial intermixture, both governments ought, in the absence of wider biological knowledge, to pass laws against intermarriage. "It is a question not of rela-tive superiority, but of prudential policy" (page 86).

President Scherer, it will be seen, is no Japanese alarmist, but he is perfectly clear in his own mind that Americans, with their standard of living, cannot compete with the Japanese on the land, and he therefore holds California justified in trying to prevent Japanese land ownership, but unjustified in refusing, hecause of pressure from business interests, to prohibit all alien ownership of land, thus making a discrimination against the Japanese. He points out, however, that is was not California that hy her alien land law created the discrimination. The United States had already done that by refusing naturalization to yellow and brown and red

The final plea of the book, then, is for national control of our international relations. by constitutional amendment, if necessary, and for a rational code of naturalization laws. Rarely is more real information, sound judgment, and friendly reasonableness packed within a hundred and fifty small pages.

Dr. Steiner's book has the distinct merit of recognizing that the awakening of Asia has a profound significance for the world at large, that it creases a distinct problem for us and demands that we look the facts square in the face. The author calls his book "a study in the psychology of inter-racial con-" and in his view the essence of the difficulty is psychological and therefore racial, rather than economic. A race that bears a distinct external mark is thereby set off by itself; the prejudice that most people feel against those who are different from themselves attaches to all members of the group almost irrespective of individual characteristics. Hence it is not a question of superiority, but simply one of difference.

In consequence of such prejudice, the Japanese in this country, despite their adaptability and their eagerness to acquire American ways of living, are still segregated and isolated. Under such conditions, a people like the Japanese, eagerly seeking full recognition as equals among the nations of the world. and feeling themselves entitled to it, naturally enough insist on being allowed to enter, so far as they are individually worthy, the charmed circle of peoples who are allowed full political and social rights here. This fact, combined with our race prejudice, creates a difficult situation.

Back of this eager insistence, Dr. Steiner points out, is the pressure of economic necessity, the outward thrust of a densely populated and poor land toward a sparsely settled continent of enormous resources. The last-mentioned fact gives the awaking of Asia its significance for the western world, and the United States, as the frontier where the two civilizations meet, must face the situation squarely. But the right of unre-stricted immigration into this country would not materially improve the state of affairs in the East, Relief must come by internal in-dustrial development and social progress.

When that development comes, but not before, we can open our doors to Asiatic as to European immigration.

The working out of any policy, however, is complicated by our race prejudice. Unit is a fact of vital importance in our present situation. The inconsistency such prejudice with our political principles is irri-tating to an intelligent people, and combined our lack of military strength, tends to earn for us Japanese contempt, in Dr. Steiner's judgment. Clever and ambitious people, the lapanese already among us will not submit to segregation in an inferior status, as the Negroes have thus far done.

"Their reaction to segregation will more likely be similar to that of the Jews, who, in spite of their excellent qualities, have tended to make a place for themselves in the European countries where prejudice against them was strongest by taking advantage of the moral weakness and disorganization of the people among whom they lived. A clever people like the Japanese will make a place for themselves in America in spite of all obstacles. Just what will be the nature of the place that our race prejudice will compel them to occupy is worthy of serious con-sideration" (page 192).

Dr. Steiner, then, holds increasing race contacts to be inevitable, and like all serious students of the problem, he has no cocksure judgments as to the results, recognizing that there are two distinct phases of the matter, one social, intellectual, emotional, the other biological. Our immediate concern is with biological. the first.

On our own side our task is to see that American-Japanese contacts take place under only the best conditions, in order that prejudice be broken down, while the Japanese must see the wisdom of permitting only the best representatives of their race to come to this country. "The American-Japanese problem must be worked out by a gradual process which it may take generations in order to make complete" (page 193). Whether the issue between East and West will be worked out along peaceful lines or not "depends upon our skill in handling the situation and upon the prestige that our country possesses because of its fighting strength" (page 209). The second half of the prescription may conceivably be questionable; the first certainly is

These two books may well be read together. Dr. Steiner is perhaps inclined to under-estimate the importance of economic competition in America as a coordinate factor with race prejudice in creating the situation on which mischief-making sensation mongers in both the United States and Japan play for their own purposes; while it was no part of President Scherer's purpose to discuss race prejudice, but only to indicate the actual problem created for us by Japanese immigra-tion—a problem, in his judgment, essentially economic. The two books together constitute an excellent study of the Japanese immigration question. Both are soher, restrained, informing, useful.

Mr. McCormick's volume is their opposite in every respect. It deals with the diplomacy of the past twenty years in China, and is a thoroughly mischievous work. Its author begins by telling us that he has forgotten who told him some of his "facts," that many of them had no chronicler but himself, and that they "cannot be publicly ascribed to their sources, many of which are official and con-fidential." Having thus freed himself from all hampering restraints, he proceeds to re-late the sordid and well-known story of in-ternational finance, trade and investment in China, as seen in the diplomatic sleight-ofhand at Peking, lending to the tale much picturesque embroidery of journalistic incident

Now the main interest of the facts lies in the interpretation thereof, and here Mr. Mc-Cormick spares not. Japan, of course, is the diabolus ex machina that has made all the wheels go round, even though the wheels were spinning merrily for decades before what are facts when we want interpretations? And the master interpretation is this: Komura, on his return from Portsmouth, set the Japanese government on a course of aggressive imperialism that fears not God neither regards man, and the Japanese diplomats have been so much more clever than those of other nations and so much less preoccupied with other affairs that men like Grey and Sazonoff and all the rest have simply moved arms and legs when Japan pulled the strings.

As for our own State Department, apparently John Hay and Philander C. Knox were not lunatics, but aside from them-well, let "In the drama of Mr. McCormick speak: modern China, Tong [sic] Shao-yi has been a political comet whose career in the field of Pacific international astronomy is worthy of the study of those 'by gosh' astrologers who so impressively inhabit the observatories of the State Department in Wash ton" (page 96)-including, evidently, Elihu Root, for the Root-Takahira agreement "was Root, for the Koot-I akantra agreement "was a piece of hopeless insanity by the American State Department" (page 101). Mr. McCormick's judgment and language are not marked by diplomatic restraint, nor

does he sift evidence with care or display profound knowledge of the complicated mat ters with which he deals. Thus we learn at page 242 that our trade with Japan represents a golden gifr to her of an annual halance of twenty-five million dollars and over." course we settle our trade balance by sending each year a shipful of double eagles. On page 246 we find, somewhat to our surprise, "had nationalized all important that Japan industries by lending them state funds," though we know that in fact the government turns over everything as fast as it can to private enterprise, curiously reversing our western method. Again, we discover (pages 3, 265) that it was the seaman's act that drove the Pacific Mail out of our western watersand so it goes. It is truly fortunate that there are some facts that have had other chroniclers-and interpreters-than Mr. Mc-Cormick.

After reading two pages devoted to the deliberate insult that Japan gave us by sign-ing her "predatory pact" of 1910 with Rus-sia actually on July 4—let us beware that we sign no rreaties on May 5, for that is the boys' birthday in Japan-after discovering again to our sorrow (page 328) that we are just like China, this time in having "about and plunderable wealth," and after finding wherever we open the book how unfailingly righteous have always been our aims in the Pacific and how wholly unboly those of Japan-after these and many similar experiences, we are not surprised to learn (page 291) that "the conflict between Japan and the United States is centered in moral principles of life, character, and national existence that find a manifestation in the Pacific and east Asia through the existence of China"-whatever that may mean; at any rate ir gives us a virtuous feeling-and that the only solution is war with a large W.

As if that were not horrid enough, it looks as though we might have to take on Europe, too, before we are done with it: "With its [the United States'] principles and policies in the Pacific a direct challenge to Japan, and with Europe behind Japan looming up across the Pacific, is it going to back down, and hunt its hiding place which never yet it has seen?" (page 337).
Well, we should rather guess not—but big

MY MOTHER AND I

By E. G. Stern. The Macmillan Com-pany. 169 pp. Price \$1; by mail of the

SURVEY, \$1.10. My Mother and I is the latest on the rapidly lengthening list of books describing in the first person an immigrant's progress along the path of Americanization. It is a significant circumstance that practically all of these later-day pilgrim-writers are Jewish. Apparently the pilgrims of other races are less tempted to analyze their own situation or have less of a gift at doing so. Another significant circumstance is that the distance traversed is great, and the rate advanced astonishingly rapid, indicating a people held down by force in the countries from which they have come, far below the level where

by natural endowment they belong.

Involved in this rapid advance is tragedy of immigrant life, the leaving behind of settled middle age by ambitious youth, to the pain and bewilderment of the old, to the demoralization, often, of the young. It is the distinctive feature of this book, in contrast to the others, to make this tragic situation its leading motive; the parent, not the child, the protagonist. Tenderly and beautifully the portrait of the mother is drawn—her simple kindness, her strength of character, her growing loneliness as the child passes more and more completely into an unknown world, her unselfish acceptance of an inevitable situation.

This is the figure we are inclined to forget, in our delight with the quick response of the young to our efforts to Americanize our newcomer. But this is the figure we must keep in mind, and provide for, if the process of assimilation is to be wholesome and complete, and My Mother and I will help to remind us. Perhaps an even more useful service of the book will be to open some blind young eyes to the true worth and value of their parents, who, although they do not understand America, have been, through sacrifice and service and love, among the most potent helpers of their children to be-

KATE HOLLADAY CLACHORN.

JUDAEAN ADDRESSES; 1900-1917.

In Commemoration of the twentieth anniversary of The Judaeans. Bloch Publishing Co. 192 pp. Price \$1; by mail of the SURVEY \$1.10.

The Judaeans are a distinguished company of American Jews who come together two or three times a year "for the purpose of pro-moting and furthering the intellectual and spiritual interests of Jews." This record of some of the addresses delivered during the last eighteen years was well worth preserving and circulating among a wider public. For, in the intimacy of gatherings where every one present knows every one else, truths are revealed and delicate strings touched which we do not find in the general literature and public speeches on the "Jewish question."

There is, for instance, a reproach to the American Jew by Emil G. Hirsch on the score that he considers his obligation to his race discharged by gifts to charitable agenrace discharged by gits to charitable agen-cies without participating in the effort of building up a Jewish scholarship and cul-ture. Equally important, however, are the interpretative contributions, such as Max J, Kohlee's The Jew in His Relation to the Kohlee's The Jew in His Relation to the Courter Century of the Jewish Immerica, and, specially a, number of et-damerica, and, specially a, number of et-America, and, especially, a number of ad-dresses on the Jew as a citizen in various European countries.

#### TO REGULATE THE DEMAND FOR LABOR

PENNSYLVANIA is the first state on this continent to have embodied in a legislative act the principle, already practiced in several European countries and advocated by economists in all, that public employment, especially on construction works, should be utilized to compensate for decreased private employment at times of industrial depression. This is possible on any considerable scale only if previous provision is made for such expenditures at times of emergency by the accumulation of funds from annual appropriations.

The Pennsylvania act resulted from an instruction of the previous legislature to the Industrial Board to report on the subject of panics and industrial depressions. Governor Brumbaugh took a personal interest in its passage. It provides for the extension of the public works of the commonwealth during periods of extraordinary unemployment caused by temporary industrial depression. An emergency fund is created for this purpose in the custody of an Emergency Public Works Commission consisting of the governor, the auditor general, the state treasurer and the commissioner of labor and industry.

This bill is only a first step, making an appropriation of \$50,000 to constitute a part of the fund; and Otto Mallery, one of the members of the Industrial Board, is now working for a substantial, regular increment to it, preferably a perceutage of the direct inheritance tax. It does not in any way provide for "relief employment" in the accepted meaning of that term, but for an extension of public works, including the purchase of materials and supplies, under the normal conditions and restrictions and through the normal changels.

The Industrial Board, under the act, is obliged to keep constantly advised of industrial conditions as affecting employment and to hold an immediate inquiry into the facts, if reports are received that extraordinary unemployment, caused by industrial depression, exists in the state. If these reports are

confirmed, the board has to report to the governor who is then empowered to call together the emergency commission which sanctions the extra expenditure.

The board is urging the same policy on the larger cities of Pennsylvania with the hope of gradually making it the accepted method of procedure in all towns and boroughs. It has been pointed out that the magnificent public works in many German cities are due to the accumulation of such special funds, often for long periods of years, to be spent at times when the state of employment and other considerations combine to make the execution of large works of construction particularly desirable.

Similar proposals made in a report of the New York Mayor's Committee on Unemployment, about to be published, will be discussed in a forthcoming article in the SURVEY.

#### COMPENSATION FOR THE LONGSHOREMEN

HE longshoremen, left by a decision of the United States Supreme Court without the protection of a workmen's compensation law, have had their privileges restored by a bill which passed the Senate on October 2, and the House on October 5, the day before Congress adjourned. The bill thus rushed through in record time was drawn by the American Association for Labor Legislation at the request of the New York State Industrial Commission, after the decision in the Jensen case had held that longshoremen do not come under the jurisdiction of the state workmen's compensation laws. The desired effect was accomplished by an amendment to the federal judicial code.

#### A CORRECTION

THE last word in the middle colmm of the page facing this should be "fie"—not "hig." The form in which this typographical error occurs was entirely printed before it was discovered. Apologics are due and are hereby rendered Professor Musey—Editor. Representatives of the United States Burnau of Labor, the Industrial Commission of New York, the American Federation of Labor and the American Association for Labor Legislation worked for the passage of the bill. In commenting on it after its passage, John B. Andrews, secretary of the American Association for Labor Legislation, said:

The men who load and unload vessels are at this time peculiarly indispensable to the country and to the allies in the successful conduct of shipping. In preparing the bill upon official request it was aimed to open the way for a comprehensive application of state compensation laws to industrial accidents in marine employment.

# WORKING THE SCHOOLS DOUBLE SHIFT

F the author of the famous sentence I in the ordinance of 1787, "religion, morality and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." could view a typical American public school system today he would probably refuse to believe his eyes. He would find children singing, dancing, listening to lectures and concerts, attending clubs and mass meetings for public discussion, and taking part in athletic exercises and games at times when in his day school buildings were locked and dark. And he would find adults doing these same things in as great or greater numbers than children.

Interesting light on the current transformation of the public school in this country is shed by a bulletin written by Clarence A. Perry, of the Russell Sage Foundation, and just published by the United States Bureau of Education. This contains the first data upon afterclass activities gathered under the bureau's new school-extension record system. During the year ended June, 1916, 463 cities conducted 59,218 group activities in public schools after 6 P.M., entirely exclusive of night classes. Since cities were relied upon to do their reporting, these figures are probably too low, a number not taking the trouble to fill out the questionnaire sent to them.

PAPER, LARGE OCTAVO, 285 PAGES, PRICE POSTPAID \$1.00

# AMERICAN ASSOCIATION for ORGANIZING CHARITY 22nd Street and Lexington Avenue, New York, N. Y.

Physical activities, such as gymnastics, games and folk-dancing, received the most attention, 17,000 of the occasions being devoted to them. Clubs, both social and athletic, come next, with quiet games, concerts and adult society meetings being about equal in the attention they received. The cities that report paid extension workers number 150.

School buildings are being used more and more also for election purposes, both as polling places and for holding primaries. One hundred forty-three cities report such use during 1916.

# TEXTBOOKS OF THE NEW

IN order to bring "the lessons of patriorism and of national and international relations within the comprehension of children" the federal government is resorting officially to the use of lesson leafters in public schools. These will consist of reading matter to be put directly into the hands of pupils. Leafters of thirty-two pages each will be issued every month from October to May. Each issue will be divided into three lessons, one for the fourth, fifth and sixth grades, one for the seventh and eighth grades and first high school classes. The leafters will be issued by the Food Administration and the Bureau of Education.

The object of the instruction to be given is declared to be "to educate a rising generation that will know better than its predecessors how to conduct the business of living." Conservation is to be one of the keynotes. To begin with, home and local problems will be emphasized. Prof. Charles H. Judd, director of the School of Education at the University of Chicago, who is editor of the leaflets, hopes thus to work outward from a center familiar to all pupils into wider fields that they know little of.

The October leaflets contain lessons on The Western Pioneer. The Varied Occupations of a Colonial Farm, and Spinning and Dyeing Linen in Colonial Times. These aim to show pupils how simple were the wants of our early colonial days, when the home was the school, the hospital, the factory, the recreation center and, many times, the church.

As society became more complex, work left the home to seek water-power, factories grew up and public schools, hospitals, and transportation, city water systems and all the complex structure of city and the system and all the complex structure of growth, it is expected, will give a vivid picture of production, transportation, distribution and conservation of natural resources. School children will learn the interdependence and solidarity of the peoples of the world. The first lesson in the October leaflets, for example.

points out how war involves cooperation and economy. France, withdrawing her artisans, chemists and engineers from the firing line, is held up as an example of intelligent cooperation.

The adoption of the plan followed a letter addressed by President Wilson to school officers throughout the country, urging them to "increase materially the time and attention devoted to instruction bearing directly on the problems of community and national life." At an aggregate cost of eight cents, it is said, each pupil can be supplied with 256 pages of reading matter during the year. Reprints will be obtainable from the superintendent of public documents at Washington.

# THE NEW WAY OF HEALING WAR WOUNDS

IF anyone doubts that the "public" is interested in even such technical matters as the prevention of suppuration in war wounds, he must have changed his mind could he have seen the crowd that packed itself into the New York Academy of Medicine on the evening of October 5 to hear Dr. Alexis Carrel tell of his treatment of wounds by drainage. Khaki sat side by side with civilian dress, but the audience held also meny who could not claim either an M. R. C. or an M. D. degree.

Briefly, the achievement which Dr. Carrel worked out at the American Ambulance at Neuilly is this: A way was found by which an antiesptic solution, which should be potent without being irritating or destroying good tissue, could be kept for prolonged periods in close contact with infected portions of wounds.

This is made possible by inserting in a wound several tubes from a single fountain, each having lateral punctures in addition to the opening at the end. Around these tubes a light wrapping of sterile gauze is placed. Then at inter-vals of about two hours, a special solution known as the Dakin-Carrel solution pours slowly into the tubes and reaches all parts of the wound and is held there by the apparatus until absorbed. The first step, even before this drainage technique begins, is the thorough cleansing of the wound. Clotted and infected tissue is cut away; careful search is made for bits of clothing, splinters of wood or even soil and gravel, which may have been forced into the body at the time of the injury, especially if the wound has been caused by a high-power explosive. If the man has had to lie for some time on the field or in the trench, infection from his environment is inevitable. Another source of danger is gas gangrene. or the growth deep below the surface of organisms which spread through the body, rapidly causing a formation of

The good Google

Dr. Carrel finds that often twentyfour hours suffices for this treatment,
and that by that time the wound is free
from infection and may be closed. The
determination is made, bowever, not
upon external appearance of patient or
wound, nor upon feelings general or
local. Constant bacteriological tests
are made, and not until a smear is three
times found free from bacteria is it
deemed safe to go on to the final task,
that of closing the wound. In all, four
steps or stages represent Dr. Carrel's
method: Mechanical stertilization, chemical sterilization, bacteriological control,
and the closing

The important point in the discovery was the finding of a solution which would not irritate. Several earlier experiments on record were abandoned because of failure at this point. The results are to be credited to the splendid teamwork of different scientists—physicists, chemists, bacteriologists and a mathematician—who together worked out this problem and made suppuration in hospital surgery forever unnecessary. The illustrations in color which Dr. Carrel showed were from his own hospital cases in France.

#### PLOTTING THE SOLDIER'S MENTAL CURVES

IN four of the army training camps psychologists have begun the task of measuring the mental ability of every soldier there enrolled. The object of this work is not merely to eliminate mental defectives; rather, to find exactly what kind of work each man can best do in order to avoid misfits and their costly consequences. Emphasis is placed upon the positive aspect of the work. As Major Yerkes writes in the current issue of Mental Hygiene:

In military as in industrial organizations reasonably suitable places can be found for those of little intellectual capacity quite as readily as for those of great ability.

So the psychologist is studying the soldier with the view of classifying him according to his mental characteristics and placing him at the task for which he is best fitted.

The tests upon which this classification is to depend have been prepared by a committee of the most representative psychologists of the country. Out of their experience they drafted a plan of examination and measurement. Then they tried out this original plan upon groups in all parts of the country, and according to results modified or extended it.

Members of this committee were Dr. R. M. Yerkes, of the University of Minnesota, chairman, who is now in charge of the section of psychology at the army headquarters, Washington; Prof. W. V. Bingham, Carnegie Institute of Technology, Pittsburgh; H. H. Goddard,

# Replenish Your Linen Chest

# For The Winter

Mc Cutcheon's

The orderly and systematic way to keep track of the wear and tear on your Household Linen is to count it over and check it up at the beginning of the winter season. Then put in a complete order for the necessary new supplies to bring your outfit up to standard.

Such an annual inventory may save the excessive use of the expensive "best" Linen; it may disclose undue laundry damage.

We carry the largest range of exclusive patterns to choose from and the widest choice of qualities. We guarantee that the Linen is *Pure Linen*. This sixty-year-old principle of dealing in Pure Linens only has not been deviated from one iota even in these difficult times. These facts combine to make "The Linen Store" the natural place to come to with your buying list.

Incidentally, we are very slow to discontinue a desirable pattern once adopted, and your purchase in all probability can be matched five or ten years hence.

Table Cloths and Napkins

Fancy Table Linens

Blankets and Comfortables

Bed Linens and Spreads

INDEX to Volume 38 of the SURVEY (April-September, 1917) will be ready soon and will be mailed to libraries and to all others who have asked for earlier indexes. Sent free to others on request to the SURVEY, 112 East 19 street, New York city.

mittee on war work these significant beginnings are being made. The chairman of this committee, Major Pearce
Bailey, has been placed in charge of the
entire field of psychiatry. He has under
his direction, in addition to the psychologists, a corps of over two hundred
psychiatrists and neurologists. These
are now on duty in all the camps examnining all recruits in order to eliminate
those unfit for duty because of neuropathic conditions. The findings will be
important for future efforts in vocational
guidance and all educational development.

# THE LAKES WELFARE PLAN IN OPERATION

WHEN the United States Shipping agreement succeeded in preventing the strike of 10,000 seamen on the Great Lakes, they were instrumental in securing for the sailors a substantial increase in wages. This, however, was only one out of six demands made by the Lake Seamen's Union. Perhaps the most important of the other demands involved the abolition of the discharge book and the so-called welfare plan. This is a matter that has caused controversy for a number of years between the union and the Lake Carrier's Association.

The welfare plan has much in common with welfare plans of other employing corporations. But it has one important difference; sailors can be hired only through the assembly rooms which have been established in various ports on the Great Lakes, where the sailors are supposed to gather and where certain comforts are offered them for which they pay one dollar a year. When a man pays his dollar he becomes a "welfare man," and is given what is known as a discharge book. Captains are not allowed to hire a man who does not possess one of these books. When a man is hired he must deposit his book with the captain or chief engineer, and when he leaves an entry is made indicating the character of his services. To quote the printed rules of the association:

If this entry be "good" or "fair" the book shall be returned to the man, but when in the best judgment of the officer such entry cannot justly be made, and in every case of desertion or failure to serve after engaging, the book shall be returned by the master to the secretary of the association, together with a startthough the superior of the superior with a superior of the s

The union claims that this constitutes a black-list of unusual efficiency, and consequently they are bitterly opposed to the welfare plan. A study has recently been made of the plan by the United States Bureau of Labor Statistics, which is to be published in a forth-

Order from the Newsest Address

coming bulletin of the bureau. A summary of the study is published in the Monthly Review of the bureau for September.

As an indication of dissatisfaction, the report cites the fact that the rate of turnover on the association's boats, in 1916, was more than 600 per cent. "The interpretation and practical application of this open shop principle, and the actual operation of this welfare path have," the report states, "undeniably had a damaging effect upon the lake unions." The writer states that the officers of the Lake Carriers' Association are making an earnest attempt to enforce a policy of neutrality toward the union, but he continues:

The general effect of the welfare plan in the actual administration of its provisions by the general officers of the association, its commissioners, and those in authority on its commissioners, and those in authority on the control of the control

# HOW AND WHEN TO GO TO

HOMER FOLKS, secretary of the State Charities Aid Association of New York, sends the association the following cable from Paris:

After two months in charge of the Department of Civil Affairs of the American Red Cross in France, I have gained the following definite impressions:

First. A large number of new and useful social activities have been started by the French in all parts of France since the war began.

My Red by Google

Second. The plans of work of some of these institutions are extremely good, but as a whole they are without coordination.

Third. There is great interest everywhere in tuberculosis and child-welfare work, and American agencies operating here in these lines have wonderful opportunities. Fourth. There is complete accord and sympathetic coordination among all Ameri-

can organizations in France.

Fifth. If the present rate of progress can be maintained it is possible that France will have in four years, notwithstanding adverse conditions, an equipment of agencies for the prevention of tuberculosis and infant mortality second to no state in America.

Sixth. There is great need for additional workers who bring special technical experi-ence, such as physicians with special experi-ence in tuberculosis or child-welfare; trained nurses with health experience; social workers with general experience. Some knowledge of French is very desirable. All such who are willing to consider coming should apply through the American Red Cross in Washington, and start only when and as sent for from here.

Seventh. There is no need for additional Americans without special experience and special qualifications.

Eighth. All American social workers here re delighted with the favorable opportunity for constructive work.

Ninth. Everything which the State Char-ities Aid Association workers can do at home to increase the effectiveness and improve the quality of social work has an important and directly useful effect here.

Tenth. I am thoroughly convinced that American relief work here is being pushed with exceptional devotion under expert direction and promises exceptional results.

#### COLUMBIA'S FACULTY AND TRUSTEES

PROTEST against the dismissal of Profs. J. McKeen Cattell and H. W. L. Dana, two members of the Columbia University faculty whose positions were declared vacant by the Board of Trustees last week because "they had done grave injury to the university by their public agitation against the conduct of the war," has already become tangible. Charles A. Beard, professor of politics, resigned on Monday partly as a result of this action, and both John Dewey and James Harvey Robinson have expressed their resentment.

Professor Beard is one of the most widely known teachers in American universities. In his letter of resignation to President Butler he said:

I have been driven to the conclusion that the university is really under the control of a small and active group of trustees who have no standing in the world of education, who are reactionary and visionless in politics, narrow and medieval in religion.

Declaring that he was among the first to urge a declaration of war by the United States and that he believed we should now press forward to a "just conclusion," he said:

I am convinced that while I remain in the pay of the trustees of Columbia University I cannot do effectively my humble part in sustaining public opinion in support of the just war on the German empire or take a position of independence in the days of recon-struction that are to follow.

Professor Robinson declared that "we fear that a condition of repression may arise in this country similar to that which we laughed at in Germany," and Professor Dewey issued a statement in which he said:

I regard the action of Professor Beard as the natural consequence of the degrad-ing action of the trustees last week.

Professor Cattell, the trustees charged. had written letters to members of Congress endeavoring to influence them to vote against sending soldiers of the new national army to Europe. Professor Dana is a trustee of the People's Council and has been active in pacifist circles: he attended the recent meeting of the council in Chicago, which was interfered with by the police. He was assistant professor of comparative literature and Professor Cattell was professor of psychology.

Professor Cattell, who is editor of the Scientific Monthly and the School and Society and has been on the Columbia faculty for twenty-six years, is denied his pension from the university and also from the Carnegie Foundation by the action of the board.

In dismissing the two professors, the trustees said that "the members of the committee on instruction of the faculty of applied science, representing the entire teaching staff of the Schools of Mines, Engineering and Chemistry. united in a written request to the president that they and their work be protected from the ill results of the activities of Professors Cattell and Dana."

STAVEY

#### KEY

If you know the name of the agency or organization, turn direct to the listings (3d column) for address, corresponding officer, etc. [They are arranged alphabetically.]

If you seek an unknown source of information, turn to the subject index, following. The initialings correspond to capital letters in names of agencies.

If you want to know the agencies at work in any great field of social concern, turn also to this index. [They are grouped under major subject clas-sifications, as "HEALTH," printed in capitals.l

Correspondence is invited by the correspondence is invited by the agencies listed; questions answered (enclose postage for reply) and pamphlets supplied free or at nominal charges. Membership is not required of those seeking information, but ofor those seeking information, but of-fers an opportunity for you to share spiritedly and seriously in your com-munity or profession in an organized movement which is grappling with some country-wide need or cause.

If you are uncertain where to turn, address the Survey, and we shall en-deavor to get your inquiry into the right hands.

### MAKING A MAN WHOLE

CRUTCHES and canes may put a crippled soldier on his feet again. But the great task is to fit him for industry, so to train him that he can make good in the job eagerly offered him at the hospital door. Alberta, in the Canadian Northwest, has worked out re-education and the fine points of where the discipline of army officers ends and that of shop foremen begins. First hand experience, for three years, is ready for those who must shortly adopt a program for the United States. The story of it in

### Reduce Your Cost of Living!

Teduce Four Cost of Living an be reTeduced at once only by the application of 
Domestic Science, which shows how to lessen 
the food bills, how to save time and labor, how to 
keep the family in health, how to manage all the 
details of housekeeping in the best and causert way. 
Domestic Science makes the work of the housekeeptr interesting profession instead of deadening drudgery.

Gruggery.

The correspondence courses of the American
School of Home Economics were prepared by leading
teachers, especially for home study. They have been
tested and proved by over 25,000 housekeepers,
teachers, institution managers, etc.

The attractive illustrated 100-page handbook of the achool, "The Profession of Home-Making," will be sent on request. Address a postcard or note—A.S. H. E., 519 West 69th Street, Chicago, Ill.

### Essential to Health and Comfort

Mattress Protectors are necessary for cleanliness of the Mattress.

No good housekeeper considers her bed rightly equipped without Mattress Protectors.

A sheet in itself cannot properly protect the Mattress.

During sleeping hours the body in complete repose throws off waste tissues and gases, much of which penetrate the sheet and are absorbed by the Mattress if not properly protected.

Our Quilted Mattress Protectors are made from pure white wadding incased in bleached white muslin easily washed whenever necessary.

Dry out light and fluffy as

They protect your Mattress from all impurities and lengthen its life.

A single trial will convince.

112 EAST 19 STREET

Insist on seeing our trace mark and name-Excelsior Quilted Mattress Protector-on each Protector.

### NEWTON D. BAKER, Secretary of War, Speaking on War-Camp Community-Recreation Service at the National Conference at Washington, October 23, Outlined the Need for the Service in the Following Words:

"The otilide of the community has got to be continuous and growing in its hashiality and in its conscientious recognition of the right way of stolking the problem of the toldier. There boys are going to France; they are going to face conditions that we do not to take about, that we do not like to take about, that we do not like to take about, that we do not like to take about, and the continuous accifices. I want them and expanded content are about the manned; I want them adequately aread and clothed by heir Government; but I want them to have invisible armor to take with them. I want them to have an armor made up of 0 set of social habits replacing those of their hones and communities, a set of social habits and a state of social mind born in the training compy, o new solider state of mind, so that when they get overseas only removed from the reach of our comforting and restraining and helpful hand, they will have gotten such a state of habits as will constitute o moral and will tullectual armor for their protection oversear. Vou are the mades of that armor."

You are asked to contribute to the War Camp Community Recreation Fund because broad, national support is necessary to the success of the undertaking. You are really contributing hours of sunshine and recreative pleasure to the boys who are enroute to battlefield trenches. It is a very satisfying feeling to know that you, personally, have been instrumental in keeping these brave lads safer from moral harm than an army has ever been before. Your contribution buys the brighter side of warfaredances in private homes, fellowship in clubs, athletic tournaments, choruses. It means that there will always be a SAFE place for that boy to go. Let there be material help in the outstretched hand of friendship.

National Headquarters of the War Camp Community Recreation Fund, 1210 G Street, N. W., Washington, D. C. Contributions should be made payable to the order of the National Treasurer of the Fund, Mr. Charles H. Sabin, president of the Guaranty Trust Co., New York City.

### The High Cost of Good Literature

AMERICANS abroad invariably express their astonishment at the low price of books in Europe as compared with prices in the United States. In England, France, Germany, Russia, they find low-priced editions of practically every author who has achieved literary prominence. Innumerable "libraries" are published in England and on the Continent to retail (according to the binding and quality of the book) at seventy-five cents and less. These series contain not merely popular reprints of popular fiction, but the masterpieces of Strindberg, Nietzsche, Anatole France, Oscar Wilde, Shaw, Maeterlinck, Dostoyevsky, Turgenev, and others. Books by these authors retail in the United States in ordinary cloth binding from \$1.25 to \$1.75. American publishers, asked to explain this situation, have said there was not in the United States a sufficiently large demand to justify the publication of low-priced editions.

Two young men planning to enter the publishing business did not accept this estimate as correct. They asked themselves what had contributed to the success of these libraries abroad and why nothing similar had been done here.

This was the situation as they analyzed it: Books to retail at low prices must be manufactured in large quantities and without speculative risk.

For the last twenty years the book publishing business of the United States has been in the thrall of the "hest sellers." The commercial possibilities of popular fiction proved a temptation too strong for American publishers to resist. Literary standards were swept aside in the attempt to issue what the public wanted. Publishers became caterers to popular taste, and the energy of authors was diverted to supply soothing syrup literature for tired business men and bonkon fiction for ladies of leisure. The honey of literature was neglected for the saccharine of commercialism. The short story, the novel, drama, poetry, each had its day and its fashion. The successful publisher had to be awake to the public moment.

But in the matter of public taste there is no certainty, Catering to the public is a speculation and every success involves a dozen failures. Just so long as the business of book publishing remains speculative the book buyer must pay the losses of bad speculation.

To the two prospective publishers good literature seemed pre-eminently non-speculative. But they still had to learn whether it could be sold in sufficiently large quantity to manufacture at lowest cost. The judgment of American publishers was adverse, but these two men were idealists and optimists. They were convinced that American application of good literature would be no less than that of the peoples of Europe. General and widespread appreciation of good literature they felt had been thwarted in the United Strates by the high cost of good books.

These two young men planned a series of books that was to be attractively made and that would give Americans everything that foreign libraries gave the people of Europe. They started The Modern Library in the Spring of 1917 with twelve titles by such representative modern authors as H. G. Wells, Anatole France, Maeterlinck, Strindberg, Oscar Wilde, Kipling, Dostoyevsky, de Maupassant, etc. These books were bound in a beautiful limp Croft leather with title stamped in gold, printed on good quality paper in targe type and made to retail for sixty cents per volume.

The success of the series was immediate. Letters poured into their office. Some marvelled that they could publish such attractive books at such moderate prices. Others wrote to give encouragement to the new venture. Literary critics hailed The Modern Library as "The most important publishing event of 1917."

Clifford Smyth, literary editor of the New York Times, wrote: "If real merit in typography, binding, convenience, and—best of all—subject-matter, counts for anything, these books are certainly deserving of a fine measure of success. They fill a need that is not quite covered, so far as I have observed, by any other publication in the field just now."

William Marion Reedy, J. B. Kerfoot, H. L. Mencken, W. H. Wright, and a hundred other critics in periodicals throughout the country, joined in praise of The Modern Library.

In the summer six new titles were added to the series, each an example of the finest literary achievement. Among them a collection of the best Russian short stories, edited by Thomas Seltzer, and so arranged as to give the historical development of the short story in Russia. This volume includes nineteen Russian masterpieces, many of which have never appeared in English before. Also "The Way of All Flesh," by Samuel Butler, which Arnold Bennett has called the greatest novel of the nineteenth century.

There are now thirty-five titles in The Modern Library and none that any cultured man can afford to be without. Each book is beautifully and substantially bound in limp Croftleather, is printed clearly on good paper, and many-containing an illuminating introduction by either Arthur Symons, Ernest Rhys, Padraic Colum, W. H. Wright, L. Mencken, Joyce Kilmer or Lafcadio Hearn. And they are only sixty cents.

We give herewith a complete list of titles now ready;

### Crutches into Plowshares

A Lesson for the United States in the Reconstruction of Canadian War Cripples

By Douglas C. McMurtrie

ACTING DIRECTOR RED CROSS INSTITUTE FOR CRIPPLED SOLDIERS AND SAILORS

1LES from any settlement, plowing up virgin prairie with powerful gasoline tractors and gang plows—this was my first view of the training for disabled Canadian soldiers in the Province of Alberta. Ther was no need to ask if the work were practical. The "boys," as the returned soldiers are popularly known in the dominion, were out on the land doing a full day's work, with almost no assistance from the instructor who was with them, and under conditions fully as difficult as they would encounter in actual labor on a farm.

This was the class in "gas engineering, with special attention to tractor practice." The average course in this subject is about nine months in length, during which time the men learn both the theory and operation of a gasoline engine. They start on the floor of the shop with a stationary machine, which they take apart and pur together again; which the instructor puts out of gear, for the men to locate the trouble and make the indicated repairs or adjustments. At the same time the men are receiving instruction in such simple features of mathematics and engineering drafting as will be of help to them.

But this is one of the last stages in the preparation of the disabled soldier for return to civilian life. There are many others that go before.

When the men of the Canadian forces, crippled in action, began to return from the front, it was decided that the nation owed them: a duty which could not be discharged by mere pension award. The Military Hospitals Commission was recreated to provide for these soldiers such convalescent care as would put them in as good physical condition as possible, and such vocational training as would fit them again to become productive members of the community [see the SURWEY for April 7, 1917]. This was a new theory of governmental responsibility to the ex-soldier, and, in common with the other belligerent countries, Canada had to do pioneer work in the development of the system. Progress has very naturally been slow; in fact, in some parts of the dominion the complete organization of the work has not yet been effected.

The clearest conception of the Canadian plan can be gained from a study of its working in some specific district, and the most favorable for this purpose is the Province of Alberta. It seems that many of the first enlistments in the Canadian expeditionary force came from the West, and many of the earlier returns were in consequence first received there.

The injured men receive their early surgical treatment in the base hospitals in France and England, but as soon as practical, the more serious cases are invalided home. The hospital ships and transports usually disembark at an immense disharge depot in Quebec. Here the men are classified into specific medical categories, and, so far as possible, those of no further military usefulness are distributed to their own home districts. There is granted at once a furlough of from one to two weeks to enable the soldier to visit his family; he then returns to the convalescent center to which he has been assigned.

A soldier who enlisted in southern Alberta is assigned to the Ogden Military Convalescent Hospital at Ogden, a suburb of Calgary. The building utilized by this institution was formerly a hotel which, due to miscalculations regarding the direction of real estate development, was not being used at the time the war opened. There is also an annex, a store building made over into dormitories.

The main building contains the administration offices, small wards and private rooms, quarters for masage, electrical work, and other medical treatment, general dining-room and kitchen, diet kitchen, bowling alley, library, a lobby of generous dimension, and three classrooms. In the annex there is also a carpenter shop, in addition to dormitories and rooms. Cases requiring more or less active medical treatment are housed in the main building; men in an advanced stage of convalescence live in the annex across the street.

The institution is military in organization and discipline. Though the Military Hospitals Commission is a civilian body and a separate department of the government, it was thought wise arbitrarily to attach to it a military auxiliary known as the Military Hospitals Commission Command, charged with

The Survey, November 3, 1917, Volume 39, No. 5. 112 East 19 street, New York city

GREAT CHANGE FROM DIGGING TRENCHES

the exercise of military authority over the soldiers, not yet discharged, but under the care of the commission. As the men are convalescent from serious injuries, the disciplinary administration is not exacting, but in cases of serious misbehavior there is available all the machinery of courts-martial.

The medical treatment and the military routine take but little of the men's time. Most of the day is free for good use or ill. Here appears the new feature in providing for the disabled soldier. The commission provides occupation in various classes and shops for the men who are willing to participate. This work has a double purpose.

First, it acts as occupational therapy; it benefits the mental condition of the men by giving them something to think about beside their own troubles; it is an advantage to their physical condition in that it brings into play—involuntarily on the man's part—disused and semi-paralyzed functions. To many men who have given up hope of ever again doing useful work, one simple operation mastered leads to the attempt at still another. Thus is ambition kindled once more.

Second, the work in the shops and classes has a direct practical value to most of the men. There is evident advantage to adult men on the verge of return to civilian life in "brushing up" the subjects they learned in school. A farmer taking even a short commercial course will be setter able to keep accounts of his business transactions; the householder learning at the bench to make simple articles of furniture will find this facility very useful, in doing odd jobs around his place.

Occupational therapy is thus the first category of vocational work, which is undertaken rather casually during the period of physical convalescence. Such activity would terminate with completion of the medical treatment. The second category—and the one of by far the greatest economic consequence—is known as vocational re-education. This is intended for men whose permanent disability debars them from returning to their former occupation yet who would profit from retraining in some subject within practical limits of instruction. This category embraces the serious and thorough preparation of the war cripble for self-support.

The administration of the vocational work is in the hands of the vocational branch of the commission, directed by T. B. Kidner. The local work in the province of Alberta is in the hands of Dr. James C. Miller, hard-headed and practical in spite of his scholarly attainments, a man who, as director of vocational education for the province, has been accustomed

THE HENS MAKE PETS AS WELL AS A LIVING

to relating educational plans to the practical requirements of the industries.

Education is a provincial function in the dominion, and by reason of differences as to language and religion, the prerogative has been jealously guarded. In some provinces this has led to embarrassment. In Ontario, for instance, there has been built up a local organization for vocational training of disabled soldiers. The local and detail direction is provincial. the financial direction federal. This division of authority does not make for efficiency. Though the national commission may provide funds for a certain facility, the provincial officials may delay indefinitely in providing it. Though the instruction authorities may wish to put some plan into operation, the national officials may thwart it by refusal to grant the necessary funds.

In Alberta there has been worked out a more logical arrangement. The provincial director of vocational education is employed on half-time by the Military Hospitals Commission and is thus responsible to the commission for the positive aspects of the work, which is conducted to all intents and purposes as a national activity. In a negative way, he is responsible to the province to see that nothing is done prejudicial to Albertan interests. Controlling both the national activity and the provincial agencies of technical education, he has no difficulty in bringing about desirable cooperation between the two.

At the Oaden hospital, the convalescent soldier is urged. as soon as he is able, to attend one of the classes which are there in progress. The decision to do so is voluntary, but the vocational officer and his assistants have so stimulated interest among the men that requests are received from them when still in bed to save places for them until they can get about.

There is a general commercial course within the general limits of which the pupils specialize in bookkeeping or in stenography and typewriting. The minimum length of the course is six months, and, whenever desirable, the period is a clerk in a hardware store, a third had been a restaurant employee. The effort is not to turn out expert accountants, but rather men so trained that they can keep books of a retail store or do work of similar caliber.

Another class is for teaching the English language to disabled soldiers of allied nationality-foreigners who had enlisted for service in the Canadian forces. The objective method of instruction is used, the men being taught the English words for specific objects, and later shown how to construct sentences to express their simple wants. This makes it unnecessary for the instructor to know the native language of the pupil, and it is possible to have in a single class men of varied tongues.

A third class is in preparation for civil service examinations, with a view to employment in the postal or revenue departments. This is especially appropriate, as returned soldiers are given preference in appointment to civil service positions. Arithmetic, spelling, composition and commercial geography are the principal subjects of instruction.

#### Outdoor Work Especially Helpful

In the woodworking shop the men can have elementary training in carpentry. They make simple articles of furniture, which they are permitted to take home when leaving the hospital. There is also training in mechanical drafting.

For the men whose disabilities made it important for them to be out of doors, a garden club and a poultry club were formed. Gardening and care of chickens proved the most valuable of all the occupations in the way of beneficial exercise. The men's appetites became more normal and their sleep less fitful; the exercise was especially beneficial to the men who had suffered from gas poisoning. There are eight or ten chicken houses for the men taking poultry work. Each of the garden workers has a plot one-twenty-fourth of an acre in extent, the product of which he is free to dispose of. Several of the men took prizes on their products at the agricultural fair.

All the work so far described comes within the category of occupational therapy, which may be entered upon infor-

THE MOTOR CLASS

mally by any man resident at the convalescent hospital, but which would cease when the medical officer declared treatment completed and discharged the man from the institution.

But it has been provided that any man debarred by disability incurred in the war from resuming his former employment, yet capable with special training of becoming self-supporting in some new trade, may be "re-educated" at the expense of the Military Hospitals Commission. As early as possible in the man's convalescence he is interviewed and put through a "vocational survey," in order to determine what is the wise course for him to pursue. The soldier is informed regarding the possibilities and, after his confidence has been gained, he is advised by the vocational officer. It is necessary, however, that the final choice be made by the man himself. He then comes before the Disabled Soldiers Training Board, made up of the district vocational officer, the medical officer, and a representative of the local employment organization dealing with placement of returned men. This board reviews the program for the man's training, approves it if satisfactory, determines the place and method of instruction, estimates the length of the course and the cost and recommends the proposal to the authorities of the commission at Ottawa. If there is no objection, the district vocational officer is instructed to carry out the plan suggested.

If the crippled soldier enters on the determined course of training and decides he made a mistake in his choice, he is given an opportunity to change by going again through the same process. If he does not make as rapid progress as expected, his period of training may be extended.

The man approved for re-education may thus be discharged from the army without prejudice to his educational work. As his military pay ceases, his pension and vocational allowance begin. The separation allowance to his wife is also continued. The net total of these various payments is about equivalent to what he received while still in the service. He may thus pursue his training without the burden of financial worry.

The informal occupational work frequently dovetails with the re-educational instruction. Thus a man who casually enters a commercial class and finds he likes the work, may continue at bookkeeping under the re-educational category. The simple shop work of the invalid often helps to disclose a mechanical talent along one line or another.

The choice of trades in which war cripples may wisely be trained is of primary importance. In addition to considering whether men with certain types of physical disability can engage in a given trade, its present and prospective employment possibilities must be taken into account. If it is a seasonal trade, if the number of workers in any locality is so small as to make difficult the absorption of many newly trained men, or if the industry is on the wane rather than enjoying a healthy growth, the indications are negative. The ideal trade is one in which the wage standards are high, the employment steady, and the demand for labor constantly increasing. In picking trades, the present boom conditions are discounted. It is also necessary to relate the choice very intimately to conditions of the local labor market.

In this particular connection, Alberta was in an unusually favorable situation. Just prior to the war there had been planned a vocational survey of the province, the results of which were to determine the lines in which additional trained workers were required, and thus to indicate the subjects in which vocational education should be provided. The findings of this survey came in very usefully in dealing with disabled soldiers, because the jobs for which employers needed more trained men were just those for which the disabled soldiers might most profitably be prepared.

Within the limits of choice industrially imposed, a wise determination must be based on past experience. A competent journeyman bricklayer who has lost an arm may be prepared by a suitable course in architectural drafting and the interpration of plans, to take a position as construction foreman of a bricklaying gang. It were idle to give such a man a course in telegraphy. But a train hand who has been all his life familiar with railroad work may most wisely be trained as a telegraphic operator, with a little commercial instruction on the side. This man will then be fitted to obtain employment as station agent at some minor point on the road. There is an additional advantage in instances such as the two mentioned in that the former employer will be willing to engage again a man with whose record and character he is familiar

—once there is assured his competence in the new capacity. This rule applies, however, only to men who were, previous to their enlistment, operatives in the skilled trades. Their problems are the simplest of solution. But in the present war, when not only professional soldiers but whole nations are in arms, there will return disabled many young men who had not yet attained a permanent industrial status. Some will have entered the army direct from high school or college; others will have been migratory workers, who had not yet found a permanent niche and whose experience has been too varied to

LEARNING INDOOR TRADES

be of much value; still others will have been drawn from unskilled and ill-paid occupations which hold little future opportunity for the able-bodied worker, and almost none for the physically handicapped. Among the latter will be found those who have been forced to leave school and go to work at too early an age, and to whom society has not given a fair chance. When they now return from the front, crippled for life and having made a great patriotic sacrifice, it is surely the duty of the state to repair so far as practicable the former inequality of opportunity and provide for them the best possible training. It would be a cause for national pride if, in the future, such men could date their economic success from the amputation of their limb, lost in their country's service. And this is entirely within the realm of probability.

All the re-educational work of an industrial character is provided at the Provincial Institute of Technology and Art, at Calgary. The pupils as civilians live with their families, board where they please, or, if they desire, live at a military depot. They attend the institute as day pupils. This Provincial Institute of Technology and Art had been organized as a link in the general system of public education in Alberta. Its plan was most practical; in the words of the director, "it was to perform the same service to trade and commerce as do the universities to the professions." When the returned soldiers began to arrive home, it was decided to defer its opening to regular pupils and turn it over temporarily to the use of war cripoles.

Here a variety of trades are taught most capably; they cannot all be described in detail. There are courses in machineshop practice, gas engine operation (stationary or tractor), automobile mechanics (operation and repair), electric power station practice, railroad or commercial relegraphy, surveying, architectural drafting, and the manufacture and repair of artificial limbs.

One interesting activity is the preparation of men to serve as sanitary inspectors. The course is intended especially for men who have in the past been plumbers, steamfitters or carpenters, or who have had elementary medical training. To undertake this work successfully, it is considered that the man must have superior address and personality. Graduates of this course take examinations for the certificate of the Royal Sanitary Institute, the possession of which enables them to qualify anywhere as to fitness. The men are employed by municipal health authorities, in food plants, abattoris and the like.

At the institute there are classes in mathematics, in which

THE WOOD-WORKING SHOP

LEARNING TO BE DRAUGHTSMEN

the men work out problems arising in their mechanical work, and classes in English in which they write reports of their technical activities. There is also elementary instruction in chemistry for men taking up any line where this would prove helpful.

In principle, the Military Hospitals Commission expects to meet the expense of such training. But the Province of Alberta has been more than generous in the division of financial responsibility. All capital expenditures, except a specific sum for some motor equipment, have been met from the provincial treasury, together with about half the total of teachers' salaries. The other half of the salary expense has been nationally defrayed.

Men who have educational attainments of a certain grade may be trained in the normal schools of the province to be public school teachers, manual arts teachers, or instructors in commercial subjects. These opportunities are especially good. In such instances the province meets every expense except for the maintenance of the pupil and his dependents and the books and supplies which he may individually require.

Agricultural instruction is provided in the farming schools of the province under similar terms.

To complete a description of the facilities for disabled soldiers in Alberta, it should be added that in Edmonton, the large city in the northern section of the province, there is a convalescent hospital with accommodation for 250 men, and exactly comparable with the Ogden institution already described. Here are maintained classes in commercial subjects and occupational work in gardening and woodworking. Men at any point in Alberta, approved for industrial courses, come to Calgary for instruction.

At Frank, in the southern part of the province, is a hospital for tubercular cases accommodating 55 patients. One teacher gives instruction in commercial subjects.

So much for an objective description of the re-educational facilities in the Province of Alberta. Yet with all the equipment and organization, the results might be extremely poor. Since they are, however, unusually successful, the reasons may be disclosed by a critical consideration. What conclusions evolved by practical experience will afford guidance in the organization of similar work in the United States?

One of the first reasons for success is the caliber of the men directing it. This requires no analysis or elaboration. It should not require comment.

Another factor making for the quality of the results of the

plan is its treatment as industrial rather than as manual training. Every effort is made to approximate the conditions of the men's instruction in difficulty and character to the conditions of employment which they will enter.

The teachers are skilled operatives of wide practical experience, rather than pedagogues. The first effort is to find a competent man who has seen military services overseas. The second choice is a physically handicapped civilian; the third a civilian not eligible for military service. It is an inflexible rule, however, that no instructors shall be in uniform. Even men taken from the military service perform their instructional work as civilians.

The relations of the vocational officers with the representatives of organized labor are most intimate and cordial. There is frequent conference with the Provincial Trades and Labor Council and its local branches. All the unions allow the period of training to count toward apprenticeship time required in any trade. The labor men have been helpful further in advising as to essential features of instruction and in insisting upon the importance of thorough training—that courses should be too long rather than too short, as the natural tendency would be.

The most important feature of all—one on which success or failure depends—is the character of personal relation between the educational officers and the individual men. It is to the perfection of this relation in the Alberta organization that must be ascribed the major share of credit for the results obtained. The situation throws much light also on the discussion as to whether men under re-education should, in the American plan, be retained under military discipline.

It has already been said that the decision on the part of the soldier to undertake training must be voluntary. The necessity for this is almost self-evident, for, though a man under military discipline can be ordered to a classroom, he cannot be made receptive or enthusiatic. The unwilling pupil will learn little indeed. But the voluntary choice can be stimulated and inspired.

Before urging the convalescent soldier to take up some line of occupational work, the vocational officers in Alberta make an earnest effort to become personally acquainted with him and to gain his confidence and friendship. They address a man as "Mr. Tackson"-a small point, but noticeable after visiting other training schools for disabled men. They treat him in every way as an equal, no more and no less. In dealing with a civilian, the returned man is entirely at ease and talks confidentially over all aspects of his present situation and future prospects. In this relation it is easy to persuade him to undertake some activity instead of passing in leisure long hours of tedium; particularly is this true when the class work is interesting and the results useful. It should be recalled, however, that the relation described is not easy of establishment between a private in the service-worn out and discouraged-and a superior officer. In the presence of a major the average private is more or less awed and not in a position to discuss freely personal and intimate details.

So the vocational officers establish over the men an influence more effective than cold and formal discipline. It is established by painstaking individual attention, tact, an understanding sympathy, and personal force. Its establishment is costly in that the number of soldiers under such "discipline" by a given man is limited, and in that the strength of character and general caliber of the vocational official must be well above the average. Lacking in these qualifications, the adviser must be a failure in his job, and the quicker he is weeded out the better for his pupil veterator. When one of the soldiers, a foreigner who spoke English with difficulty, returned home—after an absence at the front of nearly two years—to find his wife on the point of delivering a baby, he came in his trouble not to the military officer resident at the institution, but to "his friend," one of the vocational officials.

Let us now consider the fitness of the military officer in dealing with the economic rehabilitation of disabled men. With armies recruited from civilian populations, as has been the rule with the democratic peoples in the present war, organizations have been effected almost over night and promotions have been spectacular and rapid. It does not follow, however, that the man who makes an effective fighting officer in the trenches will be apt in dealing with matters of social and economic character. The officer, who enlisted as a civilian for overseas service and has returned disabled and of no further military value, would ordinarily desire his discharge from the army at as early a date as possible so as to return to his former occupation. The man who wishes to remain on the strength. considering it a good job, will probably be of the least desirable type for the work in hand. And a regular army officer would be quite out of touch with industrial require-

If it is argued, however, that line officers should not be utilized in dealing with the returned man, but that civilians specially fitted by past experience to deal with the physically handicapped should be commissioned for this purpose, it may be observed that the men who have done duty abroad seem to have no respect whatever for the officer who has not seen similar active service and been exposed to the same dangers as have they themselves. It has been found in Canada an administrative necessity to put in charge of institutions for returned men, officers who have themselves been invalided home from France. They regard the uniform as a badge of military honor, to be won in actual battle experience and, although they have entire respect for a civilian expert in some particular line, they would not have the same respect for the same civilian if they considered him masquerading as a military officer when not actually a military man. If expert civilians are to be used for this purpose there is still another reason against commissioning them and putting them in uniform. This consists in the natural breach between the officer and the private, to which reference has already been made.

An example of the cooperation of educational authorities and pupils may be seen in the students' council at the Institute of Technology and Art. This council has limited powers of self-government. It works out the social and recreational program and recently voted for an increase in the daily hours of work. The school management asked the council for advice on the content of some of the courses. The answers were seriously considered, and many of the recommendations were adopted and incorporated into the curriculum. Such a relation discounts the agitation of the "sorehead." The men have particularly requested that they be thoroughly prepared for the employment to which they will go, even if studies must be made harder.

That the men appreciate the value of training has been evidenced in several ways. Some graduates of the course in moving-picture operating who were already at work in regular jobs asked if there could not be organized for them a morning course in opties, so that they might be enabled to make further progress in their field. Needless to say this was gladly done.

The work in Alberta is still in its infancy, but its service already to the war cripple is well worthy of imitation,

### Social Christianity Pays Honor to Its Pioneers

### By Graham Taylor

T is a far cry from the time-a generation ago-when Washington Gladden's messages rang from Springfield, Mass., as a voice in the wilderness, to the day-a fortnight since-when the thousand delegates of the National Congregational Council instinctively rose to their feet to greet him as he rose to endorse the report of its Social Service Commission. The clamor, suspicion and rancor which for many years had challenged his demand for the application of the common faith to the social conditions of the common life, had long since lapsed into silence. Here, bearing lightly the weight of his eighty years, he stood in his own church to receive this impressive token of the affectionate homage of the whole congregational fellowship.

And well did he deserve it, and sure was he to win it. For his vision of the future was never out of sight of either the present or the past; his steady, measured tread forward never put him out of sight of those who were facing in the same direction; his mental poise was such as ever maintained the sense of spiritual proportion and historical perspective; his balance between the passion for progress that brooks no needless delay and the patience of the "geologist's time sense" that let him dare to fail while waiting to win, assured his reaching the goal. While under the continuous fire of criticism through all these years, which not seldom degenerated into misrepresentation, unwarranted suspicion and even bitter ostracism. his Christian spirit and his loyalty to the church, his brethren in the ministry and the great human cause never flinched nor failed. At once nestor and contemporary, leader and comrade, pioneer and conservator, civic soldier and "sweet singer" of Christian hymns, leading writer and first citizen of his city, minister, and more than all, manliest Christian man, the signs of the times that now are and are coming to be salute Washington Gladden.

Other voices accompanied or followed his in the initial efforts to proclaim and propagate the new evangel of social Christianity. Oscar McCulloch, from his congregational pulpit in Indianapolis and by his leadership of the humanitarian advance in his city, state and the middle West, translated the old gospel in terms of modern scientific charity, and applied it through the state's reformatory, restorative and preventive efforts for the dependent, defective and delinquent classes. Prof. Francis G. Peabody led the way at Harvard for the social training of the church's ministry and laity by his practical and scholarly courses on social ethics. Pres. William J. Tucker, at Dartmouth College and Andover Theological Seminary, took the same initiative and wielded powerful influence at these two institutions. David Allen Reed, at Springfield, Mass., through long years of heroic, self-sacrificing struggle against indifference, ridicule and the withholding of financial support, succeeded in establishing training schools for the laity to fit young men for the new profession of the Young Men's Christian Association service, and young men and women for the teaching and superintendency of Sunday schools. Chief among the initiators of the modern Christian social movement, these men stood to rally followers who now are everywhere at work in city and rural

socialization, in pulpit and press propaganda, on the farflung missionary frontier abroad and across the frontier in the rear at home, "clearing" and directing their efforts through social service commissions in every church fellowship and through that of the federal council of practically all Protes-

Similar initiative and fast-pervading organizations are resulting in the varied social work of the Roman Catholic parishes, sodalities, Knights of Columbus and federations of Catholic charities and other social agencies. Jewish charities and popular educational and agitational effort for social progress have all along been in the vanguard of progressive movements.

Thus the churches are not only responding to the advancing spirit of the age, but have prompted and led it to a degree not always fairly recognized, possibly because not commensurate with the obligation, resources, and opportunities which are recognized as the advantage and assets of the church in the social movement.

WASHINGTON GLADDEN Dean of the social movement in the churches

### The Drink Problem in France

### Conditions Facing Our Soldiers

### By Elizabeth Tilton

In the light of this war France has become convinced that alcoholism is a danger as serious as Germany itself. . . . Without a decisive victory over Germany, France would lose its position as an independent nation. Without a victory over alcoholism, she would be doomed to a slow but hopeless decadence.—Jean Finot, president of the Alarm (preface to L'Alcool Contre la France, Maurevert).

WO things the American people should do and do soon: One is to learn for themselves the conditions in France into which a million of the very flower of the land will be injected, and second, to act on this knowledge. Gallant France! Submerged as she is with misery, it may be hard to protest against anything she does, but if silence should mean, not today perhaps but tomorrow, barren women, blinded children, tuberculosis, insanity, disease unspeakable, then it were cowardly not to speak and speak now.

And it is good to know that in asking protection for our boys in France, thousands of French hearts will be with us. Says the editor of the Revue, Paris, August, 1917: "The "Teddies' who arrive from the United States total or partial prohibitionists are exposed to multiple dangers and temptations. Let us take care! We shall commit a great wrong if we allow the boys of America to be exposed not only to the dangers of being slain at the front but to the still greater

danger of being slain by alcohol at the rear.'

France is the only great country where there are more deaths than births. She faces depopulation. In 1911, for example, (in every 10,000) there were 187 births to 196 deaths, a loss of 9 persons, while Germany gained 113. This disease, depopulation, was brought home to France by the fact that owing to it and to the increasing number of men who did not measure up to the required standards of service, France was obliged to demand three instead of two years' military service in order to keep her army large enough. Some acts "stab the spirit broad awake," and this event stabbed France into thinking about the reasons for her depopulation.

To what does France lay it? Various reasons are given. Lapouge (Selection Sociale, p. 188) sums up current explanations thus; the demand of the civil code, love of wealth, lascivious tastes, aristocratic pride in being an idler, and, Lapouge himself adds, the substitution of the Christian ideal of duty towards God in place of the savage ideal of duty towards the race; but principally the crossing of races in France which he thinks leads to infecundity. In recent years, however, another

cause has been added-alcoholism.

France is the most alcoholized of all the countries, her consumption in terms of pure alcohol (as far as figures are available) being 22 liters per capita, against Germany, 7.47 and United States, 6,89. As for distilled liquors, we find this wine-drinking land using 8.8 liters per capita, Germany 7.29, United States 5.51 liters (1906-10). (Drink Consumption in the Different Lands, J. Gabrielssohn, Paris,

Says Dr. Colombier (thesis 1912): "It is alcoholic poisoning that is responsible for this terrible evil, depopulation, rendering our men incapable of producing healthy offspring."

In truth, the drinking of liquor and the ever-ready opportunities afforded for drink in France are unbelievable, according to George Maurevert (L'Alcool Contre la France, 1915, p. 33). One drinkshop there is in France to every 83 persons; in Boston, Mass., about one to every 750 persons (and we think this very excessive); in the state outside, one to every 1,000 is allowed. We read that between 1811 and 1891 there were 70,000 new drink shops in France, and "the increase continues." Again and again up to 1914 did France try to get limitation of her saloons, but in vain. The capital in alcohol was too strong, nearly one-half of the active adult males in France being connected with the business (Louis Jacquet, Alcool, p. 892). And so the scourge of alcohol depopulates a nation that Gambetta called "the most moral person, France."

We hear how the first act of M. Raymond Poincare, (Maurevert, p. 57) when he became president of France, was to visit the unfortunate. At a great hospital, Dr. Jacquet, physician in charge, showed him the following figures which

he himself had collected at the hospital in 1912:

Alcoholics in hospital, 1912: Of these 111 moderate drinkers had lost 66 children 80 heavier drinkers had lost 73 children 117 very heavy drinkers had lost 220 children

Alcoholies breed, Dr. Jacquet explained, but their offspring die off quickly, and thus France succumbs to depopulation. Much moved, President Poincaré turned to the reporters and begged them to give the widest possible publicity to the facts.

### Alcohol and Depopulation

INDEED France fairly bristles today with investigations of the reasons for depopulation, and oftener than not the trouble connects itself with alcohol. In France every year over 100,000 persons die of tuberculosis (Chebasse, p. 19), and an investigation by M. Merman, director of public hygiene, in his report to the minister of the interior on the public health of France, 1906-10, brings out an exact correspondence between the districts that drink the most and those where they die the most from tuberculosis. Indeed, doctor after doctor, investigating for himself, has become convinced that, as Professor Landouzy says: "Alcoholism is making the bed for tuberculosis." For example, Dr. Cailler found that out of 95 tuberculous patients, 90 per cent were, if not out and out alcoholics, at least excessive drinkers of alcohol. Dr. Letulle says: "The Parisian workman is alcoholic before becoming tuberculous; out of 717 men that had tuberculosis I found 80 per cent who were alcoholized." Dr. Bausiwen, after a series of personal investigations, said: "The best preventive medicine for tuberculosis is to wage war on alcohol." Dr. Courmont, of the Lyons hospitals, examining 1,000 patients, found 442 alcoholics. Of these 200 had tuberculosis, although out of 588 others only 41 were tuberculous. (Chebasse, pp. 21-22.) "Reader," says M. Chebasse, "one has to confess that these figures speak out loud!"

Still more telling are the figures of those two learned men, Drs. Baudran and Brouardrel, giving a comparison of deaths due to tuberculosis in relation to the amount of alcohol consumed per capita and per annum (Chebasse, p. 23);

	berc f in			per 10,000 ts	Liters of al
From	30	10	40	deaths	12.47
From	40	to	50	deaths	13.21
From	50	to	60	deaths	14.75
From	60	10	70	deaths	16.86
From	70	10	80	deaths	17.16
From	80	10	90	deaths	17.80

Coming to insanity, we find the same alarming talealcoholism is a main source of this terrible scourge that ravages France. Dr. LeGrain, chief physician of the asylums of the Seine said. 1897: "There are confined in France 80,000 insane; one-fourth, or about 20,000, owe their malady to alcohol." As a matter of fact, he tells us, the curve of insanity and the curve of drink in France run parallel, and a careful investigation ordered by the minister of the interior showed that the districts where the people drank the most were the ones where the number of insane is generally high and that, as was to be expected, the proportion of alcoholic insane is higher than in the districts with low consumption. (Economiste Français, 1907, Vol. II, p. 943; see Chebasse, p. 27.)

It seems amazing when one knows the facts that anyone can say, "No drunkenness in wine-drinking countries." The people on the spot do not say it. Says Dr. Hercod, editor of the Internationale Monatsschrift, in French Switzerland: "I laughed aloud as I read the passage where good Dr. Sborboro says that intoxication is practically unknown in Switzerland. According to official statistics, drink with us is an operating factor in 10 per cent of deaths of men over twenty years. Twenty per cent of our mental disease, 40 per cent of our crime and our alcoholism, come from fermented drinks, wine and beer. In Italy 28.3 per cent of lunatics in asylums are there because of drink."

Says a rich French lady reporting to M. Jean Finot on conditions in the agricultural regions of France during the war: "I have had to give up working my fields, for whereas before the war my men got drunk only once a week, they now get drunk three times a week." (France and Alcoholism in War-Time, Jean Finot, Translation, American Issue Publishing Company, Westerville, Ohio,)

M. George Berry, deputy from Paris, speaking in the French Chamber, January, 21, 1913, (Maurevert, p. 62) said: "My portfolio is full of letters from commercial travelers telling of the terrible conditions in the provinces of France." He then gave the following specimen:

I have traveled for twenty years for the wine trade in Brittany and Normandy; it is sickening to witness daily such scenes as I do. I have seen parents give calvados [brandy] to children of three years. I have seen young fellows of sixteen at breakfast with a little quart of calvados to every two of them. I have seen groups of women and children lying dead drunk in the road and in the ditches. I have seen a little girl of three or four years weeping bitter tears because her mother was not giving her quickly enough her drink of brandy

Can anybody really think that this means less drunkenness than we have in the United States?

The fact is, our boys will meet in France a curious mental attitude towards drunkenness, and we may as well get to know this attitude and then meet it as well as we can. Up to 1863-70, France was principally a wine-drinker. Then came the phylloxera, a disease that destroyed her vines. In this period France greatly increased her production of distilled liquors from grain, beets, etc., and rapidly became almost insane for ever stronger and stronger beverages, until the deadly absinthe and the appetizers came to their present (1914) enormous proportions. Absinthe is said to be made of four deadly drugs and five deadly poisons.

Now there are two schools. One, the half way school, would prohibit absinthe and distilled liquors but allow wine and beer. Some members of this school declare that wine and beer are wholesome drinks. Others say they are not wholesome, but the wine interests of France are so powerful, the vineyards such an enormous industry, that there is no hope of erasing them; the thing to do is to get what you can, that is, prohibit absinthe and distilled liquors. This is one school. The society called the Alarm, of which M. Jean Finot is president, belongs to this school.

This school predominates. Many of them affirm that, of course, wine makes drunkenness but drunkenness is an unavoidable evil. Drunkenness is simply taking too much at one time. Alcoholism is constant imbibing, till one is diseased, dies prematurely of tuberculosis, epilepsy or madness, leaving, in turn, offspring that die off easily. This alcoholism they fight and they affirm that France had drunkenness before she took to absinthe but did not have alcoholism.

Against this school are the abstinents. They affirm that an anti-alcohol movement that grants wine, beer and drunkenness as necessary evils will never stop the depopulation of France from alcoholism. Total abstinence is the only efficient method. They show that tuberculosis and insanity from too much alcohol connects itself with the heavy wine-drinking that goes on as well as with absinthe, and that France had these troubles before the days of absinthe. Thus as far back as the wine drinking days of 1767, the celebrated Lieutaud (Chebasse, p. 20) wrote: "Tuberculosis comes from immod-

Courtesy Charles Scribner's Sons, New York

FROM A FRENCH ANTI-ALCOHOL POSTER

erate use of wine and liquors." In 1831, Becquerel wrote: "Diseases from drunkenness are the following—tuberculosis," etc. Again they cire various investigations showing that wine is not only augmenting the craving for the stronger drinks but a cause of trouble in itself. Thus Dr. Lancereaux in his report on Tuberculosis at the Congress of 1905 (Chebase, p. 24), shows the drinks used by 1,220 cases of tuberculosis:

Drinks with essences (like absinthe)	25
Drinks-essences with spirits	25
Drinks-spirits alone	9
Drinks-spirits and wine	9
Drinks-wine	14
Drinks-mixed spirits, wine and essence	38

There wine is certainly contributing its share. Coming to figures of wine and insanity, an official investigation made in 1907, comprising 9,932 cases, showed the following degree of responsibility for each drink (survey ordered by minister of interior, 1907, Chebasse, p. 29):

	Men	Women	Tota
Absinthe	1.372	165	1,53
Brandy	1.911	720	2,63
Beer or cider	453	211	66-
Wine	1.275	480	1.75
Appetizers (apéritives)	2,051	1,294	3,34
•			
	7.062	2,870	9,933

There wine is again an operating factor in insanity. The fact is that men tend to drinks on much of these lighter drinks that the amount of pure alcohol consumed often equals that taken by the drinker of distilled liquors. Dr. E. Q. Millett, of Berne, found that as the consumption of distilled liquor declined in Switzerland and the consumption of wine increased, the actual per capita consumption in terms of pure alcohol rose 10 per cent (years compared 1880-1884 with 1893-1902).

Dr. Forel, of the Asylum Ellikon, found in a period of eight years, that out of 500 alcoholics received, 450 were alcoholized by wine and beer (report of Brussels Anti-Alcoholic Congress, Vol. II, p. 7).

The facts, really, are on the side of the abstinents. You can not have a successful anti-alcohol movement that prohibits absinthe and spirits only but accepts wine and beer as wholesome drinks and drunkenness as a necessary evil.

The plain truth is that our boys are going to a land where wine-interests conscript much of the scientific thinking on the alcohol question, so powerful are they; a land where, for their sake, wine and beer are allowed to run like water and where prostitution runs like water too.

Up to the beginning of the war, France had practically done nothing, though her parliament had been importuned again and again. They "seesawed," we read. When bills were up against home-distilling, the deputies would say: "If it were for limiting the number of saloons, we might listen"; and when the bill was for limiting the saloons, they would say: "Now if it were for abolishing home distilling, that would be different."

Home distilling does greatly complicate the problem. This privilege of the bouiller de cru is given to men who raise grapes, apples, pears, and the like. They may distill wine made from their own fruits into brandies. These winerandies are always being made behind the door of a country home. The trickling goes on all day long, and it means constant sipping—the baby, the children, mother and father. But the thing that makes the custom so hard to remove is this: Though the sale of these home-made brandies is forbidden they are sold, the selling is winked at, and thousands of francs

thus trickle yearly into the farmers' homes from the trickle behind the door. In some districts laborers are paid in brandy. All this is pernicious, but the custom is so common that it seems few districts, if any, where it obtains, will send a man to parliament who would vote away this source of profit. One argument often advanced in parliament was that the abolition of this privilege would aliente from the newly formed republic important royalist districts which had with difficulty been won to it.

In short, the whole liquor situation is so deep with difficulties, that though the intellectuals understand the conditions and have instituted a fight against them, not until the Germans were marching on her soil did France act. Conditions at that time were terrible. An artillery officer writing to M. Jean Finot, edition of La Revue, said:

On August 2 and the following day I was present in Britany a sub-departure of trainloads of mobilized men, all invoicated to such a point that the guards were ordered to lock the compartments. Although this way done, arrived at Brest these marines continually embarrassing than useful, the naval officer in charge of the district seen them back home. (France and Althohistim, p. 2.)

The first to act was then the governor-general of Nice. He forbade the sale of absinthe on August 8, 1914—called "the victory of the Marne of anti-alcoholism." On August 16, the minister of the interior ordered the prefects of all the provinces to stop the sale of absinthe and similar drinks (Maurevert, pp. 293-295).

On March 17, 1915, absinthe was permanently prohibited by the French government, but distilled liquors, wine and ber are still for sale, though some few restrictions have been introduced, distilled liquors (over 23 per cent alcohol) must be sold with food and so on. According to information given by a French officer at Harvard University, the soldiers themselves have for a ration one-half litter of wine or a liter, of beer or cider, or one-sixteenth of a liter of rum. (A liter is a little more than a quart.)

A great fight is on to stop the sale of distilled liquors, but as yet it has not succeeded. Pictures of conditions are given in a little booklet (L'Union Sacré Contre L'Alcoollim by Jean Finot, translated in part under the title of France and Alcoholim in War-Time by Cora F. Stoddard, 36 Bromfield street, Boston), I quote extracts:

May 17, the L'Ouest Eclair writes:

"From 5 to 9 o'clock in the evening, the stations, which are overflewing with troops (young recruits and old reserviss), turn loose in the city bands of men away from home, having nothing to do, who, during these four hours, go from cabaret to cabaret, eramming themselves into low dog-holes black with smoke, where the sir seems untered to the state of the state of the state of the state of the state or esturn to the barracks.

"What can our generals be thinking of this preparation for the failgues of a campaign, and how can one conceive of the intensive training of our young soldiers under such conditions?

"Thus, well before the departure for the front, the result of this state of affairs shows itself by the daily admission to the hospitals of numerous sick—so numerous that it has been necessary to find an annex to receive them.

"Grippe, pneumonia, or some other infection that would not be dangerous to a healthe organism carries these men off in two or three days, owing to complications due solely to alcohol. The mortality among these men is frigingful. All the physicians now attached to military hospitals could testify to the fact that France thus loses every day hundreds of soldiers. At a time when so many are suffering from this war, is it not extremely painful to see those upon whom the suffering the suffering the suffering that the suffering the suffering the suffering that the suffering the suffering the suffering that the suffering the suffer

"In a city on the western front,, six soldiers whose wounds were nearly healed had permission to leave the hospital for a few hours in charge of a sergeant also convalescent. They went to a little village, stopping at the smoking-room of the place, and asked for a

Courtesy Everybody's Magazine

"Food Made into Drink Is the Most Dramatic Phase of Waste in This Country. It Is Waste of the Blood of Our Soldiers."

drink. When evening came, only one was in condition to get up and start for the hospital. The five others and the sergeant were under the table. In going through the streets, this one made himself to compicuous that he was arrested by two gendarmers and taken back medical care again. It is five comrades and the officer did not return until the next morning, and then in what condition!

The military authorities, shocked by this spree, had all seven sent to prison. The ergeant, who had served so heroically set to from that he had received mention in the order of the day, and in recognition of his exploit was going to be promoted, will be degraded. The soldiers, who had fought courageously and were to have fifteen day'c convalenceme leave of absence at home, having done their prison terms will return to the front without having been able to embrace their families.

In a document which came from St. Lunaire early in December, a lady well known in Paris wrote, among other things, the following: "Our little community has about 550 wounded who, when hardly

"Our little community has about 550 wounded who, when hardly fit to go out, spend their time in the drink-shops. Infortunate Algerians, Arabs, Moroccans or Senegalese are tempted by their French comrades, and the drunkenness produced in these children of distant lands has frightful results. They become a vertiable plague to the population, to say nothing of the danger they have to run as to their own health."

"Before caring for the wounded," a lady of great intelligence and

"Before earing for the wounded," a lady of great intelligence and sympathy writes to M. Fino, "I had no idea to what extent the of dirth can possess certain men. The soldiers who come from the people, especially, only live to get out to go to the drink-show to not estiming they destroy the results of long treatment and watchful care. This is what happened to me in the case of a sick wounded soldier attacked by albuminuria who, hardly out of bed, went out to get abominably intoxicated."

Speaking of alcohol and the wounded, M. Jean Finot again writes:

"I am told that several shelters for wounded solders established
in the outskirts of Paris by philanthropic women are on the point of
being closed. The unfortunate convaluescens, unable to resist the
tempatation of alcohol, often return home dead drunk and provoke
establish which frighten and discovarge the ladies at the head of

"For reasons easy to understand, we cannot publish the names of several ladies who have lately sent me their grievances on this subject. It would be superfluous to multiply examples.

"Mme. Z., who directs an ambulance for convalescents, told me she had to call on the police at least three times a week to have soldiers

taken away who came back dead drunk. One enterprising convalescent having a few francs at his disposal is sufficient to lead off a dozen others into a debauch.

"The evil thus increases daily. I have recently visited some twenty hospitals and ambulances, and everywhere the directresses have said the same thing: 'Alcoholism does irreparable harm to the wounded and the sick. Why is it that the government takes no action to save our poor soldiers?'

"In addition to the press of Paris, which is helping our efforts, all the regional newspapers are doing the same. There are published in them from time to time such revolting facts that one would think them impossible if the local censorship in permitting their publication did not thus guarantee their authenticity.

"Here, for example, is what we read in L'Ouest-Éclair of May 17:
"'All physicians and surgeons who have had the care of the
wounded since the beginning of the war will tell you the enormous
difference there is in the rapidity (or even possibility) of recovery
in two wounded men according to whether they are alsobolic or not.

"The most terrible mutilations heal with a rapidity that seems miraculous in a young and healthy organism; on the contrary, the alcoholics either die more quickly of super-acute complications, or cumber the hospitals for months with interminable wounds.

when the constraint of montan wan intermination would be with the work of the first leave to enter one after asset of the work of the work

"I have had occasion to confer with a considerable number of physicians who care for the military wounded. One ought to hear them relate the difficulties in certain garrisons caused by former and recent alcoholism, for the patients, barely recovered, go to the taverns for consolation and amusement."

Of course, these conditions are, as the thoughtful people of France say, deplorable. Why is nothing done? Why was nothing done in the long years before the war? The French tell us again and again that with nearly one-half of the active adult male population of France vitally interested in the liquor business, the alcohol question becomes an electoral one. To retain his seat in Parliament, a deputy must vote in faxor

of the money in liquor. Says Jean Finot, president of the Alarm (Maurevert, preface):

The best among the representatives of the people do not take up arms in this struggle. Their patriotic vision makes them easily understand all the harm that alcoholism does the country, but the desire to keep their popularity prevents them from acting. The representative spirits of the Third Republic almost always agree with those who combat the evil, but only when they are not in power. Once masters of our destinies, they retreat before the parliamentary majority which is in the power of the drink trade.

Says M. Franc. Nohain: "Our legislators like other monstrosities are preserved by alcohol" (Echo de Paris, February 7, 1912).

Indeed, it has been charged that the French government is elected to save the wine industry and to push it. For example, the French government told the Czar that if he acceded to Finland's demand for national prohibition, it would not loan Russia money. Again when Sweden had to borrow, France demanded that the duty on French wines be lowered by almost one-half (Hercod, Internationale Monatsschrift, March 1909,

In short, that worst of things has happened in France: A private interest has become so vast, so welded among the people, that it is greater than public interest in protecting the welfare of the race.

But we must not feel superior to our gallant ally. To understand all is to pardon all. Our South, our West, that did not have a very strong moneyed interest in liquor, have achieved prohibition. But our East, where there is great money in the liquor business, abounds in congressmen who fight precisely like a French deputy for retaining the business -for example, Senators Lodge of Massachusetts and Penrose of Pennsylvania. Where there is great money in liquor we behave precisely as France does and, of course, it is delicate asking France to do anything outside the camps, for though we tried for war prohibition here at home, up to now we have got very little.

Still we have taken liquor out of our camps and where possible, we have removed saloons from their vicinity, and thus we are trying to train the cleanest army ever raised. We read, however, that once in France our boys will have the French liquor ration. The following is from the Boston Transcript of August 6, 1917;

James Duncan Miller, Liberal member from northeast Lancashire, asked in the House of Commons whether representations had been received from the military authorities regarding the character of any beverages other than non-alcoholic were provided. James Ian McPherson, parliamentary secretary of the War Office, said the cauteeus were similar to those open to the British troops. No objections had been raised by the American military authorities, he added, to similar arrangements in France.

It certainly seems absurd to have a sober army here and a drinking army at the front. It seems more than absurd, it seems dangerous, when one realizes that according to Dr. Haven Emerson, commissioner of health of New York city. (letter to E. Tilton, June, 1917) figures point to the fact that 75 per cent of venereal disease is contracted under the influence of alcohol, and that beer and wine are as good procurers as whiskey-they let down the bars of control.

Raymond B. Fosdick, chairman of the Army Committee on Training Camp Activities, says that every effort will be made abroad to keep the prostitutes away from our camps. Can anything be done at the same time to keep alcohol away. for once alcohol is admitted, the problem of venereal disease rises enormously?

Delicate and difficult as the whole problem is, it must be met. What we need is a government investigation of the whole situation. The French intellectuals do understand the danger and, perhaps, we can, if the right people approach the problem, work hand in hand with our brave ally, to keep both French and Americans and all soldiers from being "slain by alcohol at the rear." At least we can ask for a "dry ration" for our boys.

### THE PARK

By Paul Lyman Benjamin

I S this the park, This gap between the tenements, This lolling tongue of the city Lapping into the water That swirls by in an endless fret and fury?

Is this the park. Where little children play in the grime of the roadway Building their dreams. Dreams of dust. Where mothers, drab and gray, Bowed with the age-old burden of maternity, Bent with the age-old burden of the race, Squat on the benches?

Is this the park, This bit of fenced-in green, This bit of walled-in blue. This bit of shut-in childhood, Is this the park?

### The Eternal Masculine

### By Cecilia Razovski

N her book Woman and Labor, Olive Schreiner makes mention of the fact that one can judge the degree of civilization which a nation has attained by the status of the women of that nation.

We who are interested in the advancement of women in this country have been supinely content to accept as true the statements made by Europeans visiting our land, that the American woman is above all other women of all other nations, the most pampered, the most educated, the most independent, etc., etc. We nod our heads in calm assent when a cultivated Japanese informs us that "America is a woman's country; she it is who has the most advantages here." We forget the thousands of foreign women who have come to us. for the most part ignorant, illiterate and without any training whatsoever, doing what their mothers and grandmothers did before them. We forget that there are thousands upon thousands of European men in our midst thoroughly imbued with the old continental standards regarding women. Yet these old standards must be changed if we are sincere in our desire to attain a higher form of civilization and progress. These strangers from across the water must be taught to discard un-American habits and conventions; to accept new ideals.

No one understands the difficulty of reforming alient standards better than the teacher in the evening school. No one again, is so well aware of the fact that the only way of reaching the foreign woman in the home is through the husband and brother at the school, since the "mamma" (as they call her) is far too busy being a "mamma" to spare any time for school. And, as in the eyes of the husband or brother, the "mamma" is not at all important, nor worthy of much consideration except to see that she performs her manifold duties promptly, cheaply and without much annoyance to her lord and master, teacher's task is rather a delicate one.

Thus soliloquizes an instructor of English to foreigners in a big city night school, as she hastens to her duties, after having participated in a suffrage parade and demonstration that afternoon, in the meantime endeavoring to think up a new lesson which will at once be diverting, instructive and civic, and will contain a feminist moral wrapped up in words of one syllable—simply but subtly.

The class has assembled. The effects of the suffrage parade still lingering, teacher asks one of the pupils what important event had transpired that afternoon. "I bought a new suit, teacher," he makes reply, which is sufficient to dampen the ardor of a suffragist for the time being, and teacher opens her book.

The lesson in the book is about a woman sewing with needle and thread. Pasquale begins to read. Explanations are made; the various pupils spell the words in the lesson and write sentences on the blackboard. "Now, Mr. Contilli," says teacher briskly, "give me a sentence with the word "button."

Mr. Contilli: "I make my wife sew a button on my coat." Teacher, who is still under the influence of the parade, is in no mood to accept the word "make," and proceeds thereupon to explain: "You do not 'make' your wife sew the button our coat, Mr. Contilli. You ask her. You say 'please sew my button on my coat,' and if she is too busy with the baby, you sew it on yourself."

Immediately there is a buzz of interest and amazement

throughout the class. "What," says Mr. Contilli in outraged tones, "my wife she no sew button on my coat, I beat her."

"But that cannot be, Mr. Contilli," patiently continues teacher, realizing with horror that she is dealing with seven-teenth-century minds so far as women are concerned; "in America, men do not whip their wives if they do not do as they are told." And teacher glances at the other men, some of whom have been in this country for a much longer period of time, trusting to receive sympathy and assistance in her effort to free her enslaved sisters.

But no; all the uses are interested, all the men are desirous of taking part in the conversation, but not one of them agrees with teacher. A woman's place is in the home, with her kitchen and her babies—the lives and training of Ameriean girls are dreadful mistakes—even teacher, asserts one man in his broken English (and with due apologies for any possible lack of respect) is not tribilling her destiny. She should "gerta da husban" "as soon as possible.

Teacher sees her opportunity and seizes it. In the simplest of English she gives these men their first lesson in the history of the woman movement—the old, old story of the industrial revolution which forced women out of the hones and into public work, winding up in an eloquent eulogy of the men of America, who were big and broad and noble in their opinions, who permitted women to be educated as men are, and to develop themselves in all fields even as their brothers.

Just as teacher finishes this primer lesson in woman's suffrage, in walks the principal with a gentleman. "Miss R, may 1 present Mr, James?" (Usual business of being delighted.) "Mr. James is connected with the naturalization office here and is desirous of addressing these men on the subject of citizenship. He has blanks, so that possibly some of the men may be willing to fill out their first papers after the matter is explained to them."

Mr. James makes a very business-like talk on the advantages and benefits of naturalization in words of not less than three syllables, and the men listen politely; if not intelligently, to his speech. However, seeing that he has not made himself clear, Mr. James asks the teacher to explain to the men just what the purpose of his visit is, and sits down to await the result.

"Mr. Zatlovic," says teacher, "tell me in your own words what Mr. James has said to you." But Mr. Zatlovic, murming that "he talk too dam big words," informs teacher that he cannot. So teacher, after many attempts to start the ball a-rolling, repeats in A, B, C language the gist of Mr. James's talk and encourages the men to take out their "first papers" and become citizens of this great free land. "You may vote after you are a citizen, you know. You have the right to help select the men who govern this country."

Here Mr. Contilli, the eternal masculine in him still harboring slight resentment because teacher has attempted to place women on the same plane with men, suddenly awakens to a staggering realization.

"Teacher," shouts Mr. Contilli, "you say American men they treat ladies just like men?" "Yes," says teacher, "they—" Mr. Contilli interrupts, grim determination in his eye: "Teacher, if I take out papers, I can vote?" "Yes," says teacher, still not sensing his drift. "Teacher," bawls Mr. Contilli, loudly and triumphantly, standing up in his dek, if American men so good, why ure can vote, and you can't?"

### Prison Walls without a Prison

### A Plan for Restraining and Reforming Offenders in Farm Villages

By William R. George

N 1899, four years after the first George Junior Republic had been started at Freeville, NY, I worked out in my mind a plan for dealing with law-breakers. When I discussed this plan with my co-workers only a few took it seriously. Many were skeptical and a few laughed outright. Since the republic idea itself had been laughed at four years catlier, I was not much aunoyed at this reception. At that time, however, I did not have an opportunity to put the plan into effect (though it has since been tried out on a small scale at Freeville), and I am now putting it before the public in somewhat complete outline because I believe the time is rije for a full and Sympathetic trial of its main features.

The plan is based on many things I have learned in my republic experience. Though possessing perhaps a novel form and exterior, it is in reality little more than an extension to adults of principles already successfully applied to young persons. The Junior Republic and its methods have become very generally understood. A brief reference to Freeville will, however, demonstrate two or three of the principles that I desire to point out before coming to the larger scheme that I wish to propose for dealing with all law-breakers.

The republic is known to be a village, very much like other villages, where boys and girls of varying degrees of waywardness and mostly of minor age live under conditions that they themselves create and largely control. Some of those who become its citizens have been guilty of crime and have been duly sentenced by the courts; others have previously served convictions in correctional institutions; some have only been unmanageable and have been sent to the republic for the training and discipline their parents could not give them; a few of the young citizens have never been bad at all. Not all are under twenty-one, for some do not tell the truth about their dages, being anxious to secure admission to the republic rather than to be sent to another place of correction. We have had them all ages up to twenty-five.

Many of the young outlaws who have come to the republic have been proud of their lawlessness. They had gained popularity with their comrades and notoriety with officials in the cities where they had lived. Their names had been printed in the newspapers; they were persons of distinction and, in their own eyes, of honor. What a change they found when they brought this spirit to the republic! Here their depredations against property and persons injured the very people who had formerly made much of them-their ewn companions. Property in the republic belongs to the citizens, and the citizens have their own laws, courts and machinery of justice, so that when the newcomer committed offenses that had formerly brought him applause, he suddenly found himself arrested by republic officials. He was tried by a court of his own companions, held guilty by a jury of his peers, and ultimately sent to the republic prison in the custody of his own pals. Wrongdoing lost its romance. The result was that his conception of his own relation to society was changed in short order. If he possessed a strong instinct for leadership, the only way he could exercise that instinct was by working

with, not against, the group in which he lived. As he was likely to acquire property himself, he soon came to have a hearty dislike for thieves who could not let what belonged to others alone.

One of the rules at the republic, made by the citizens theuselves, is that a person who does no work cannot eat. The magic effect of putting squarely up to a boy or girl (and some of our citizens, be it remembered, have been really men and women) the alternative of working or starving, has been demonstrated over and over again. Industry is a habit, and one way of forming that habit in a person competent to work, but either lazy or ignorant, is to make him understand that no food shall pass his lips until he shows a desire to be industrious.

For a while in the development of the republic, it was the custom of those who wanted our methods to be put to the test to send us the worst young characters they could lay their hands. Friends did this, as well as enemies. How well we stood the test is now known. It is not necessary in this day to argue that the republic method of reformation, involving self-government and most of the prerogatives of citizenship, has proved successful. The results speak for themselves. It is enough to point to the six other republics now in operation in this country and to the one in England.

One of my co-workers who laughed, in 1899, at the idea of extending the republic system to older offenders was Thomas Mott Osborne. Mr. Osborne was then a member of the board of trustees of the Freeville republic. He quickly came to have a different view, however, and said, in his introduction to my book, The Junior Republic:

Then Mr. George opened my mind to the possibilities of the same principles being used as a hasis for an intelligent and reforming prison system—a system which should be social sanitary drainage—nor merely a moral cesspool. At first I laughed at the iden; then I saw the truth.

Mr. Osborne discussed my plan frequently with me after, that. We agreed that there were two ways in which it might be tried out experimentally. One of these was to test the self-government features in an existing prison or reformatory and among the better class of prisoners; the other was to try it out more modestly on a farm adjacent to the Freeville republic. Mr. Osborne strongly favored the first method, I the latter. I was on the point several times of trying the plan out in the republic itself, but the citizen body seemed wedded to the established methods, (Of course I could have put the plan into operation arbitrarily, but that would hardly have been, as we say at Freeville, "republicy.") Finally, disagreements broke out among those connected with the management of the republic, and my idea of prison reform was forced for the time being into the background. When this internal warfare was over, Mr. Osborne, my closest friend for a number of years, and I were destined to continue our labors in different fields.

The plan that I have referred to, and that I have come to call in my own mind the "social sanitarium," contemplates

the substitution of a single and unique institution for all the production of the state abolishes these, however, it would obtain a large section of land and establish on this a series of enclosures, each several thousand acres in size. These enclosures would adjoin one another. Each would contain a good-sized village, resembling any village of the usual sort. There would be enough land in each enclosure for a limited amount of farming.

The outside boundaries of the whole section would be amply guarded. This may be done by a stockade or by guards patrolling.

Any person found guilty of a criminal offense would be sent by the judge committing him to the first of these enclosures. (Persons convicted of first degree murder, and possibly of second degree, also, may be exceptions to this procedure. For such offenders there could still be capital punishment, or since the feeling against capital punishment is increasing—a special enclosure farm for life imprisonment.) In this first enclosure the individual would live until he had proved himself fit to re-enter society. A group of expert penologists or "social doctors," somewhat resembling parole boards at the present time, but more highly trained for their tasks, would spend a large part of their time in the enclosure and determine when a person is fit to be released. This involves no new principle of penology and is not unlike the idea that has been described by others as the "court of rehabilitation."

In the first enclosure the individual would find himself part of a typical village life. The size of the population would be determined by the number of persons committed by the courts and, of course, vary in different states and at different moments, depending partly upon considerations that I shall mention presently. The population might be one thousand or it might be ten. The same freedom of action that the resident of any village enjoys in the world outside would be allowed here within the enclosure. People would dress and act in the ordinary way, they would be subject to the laws of the state and conduct their own local government.

They would earn their living by their own work. There would be trades to follow and professions to enter. Friends and relatives would be allowed to visit them, and possibly a prisoner's family might reside with him if it desired. That would be a question to be determined later by state authorities. At any rate, every moral force that would benefit the men residing in the enclosure should be permissible. It might be that all money possessed by prisoners would be taken away from them when they entered, to be restored when they left. They would be allowed to acquire property in the enclosure itself, with the exception of land. Individuals might lease small lots of land, but the title would remain in the hands of the state. If those sent to the enclosure had business interests on the outside, they might keep in touch with their associates, though it might be desirable to deprive them of the right to receive income from such sources. They would retain the rights of citizens in matters of government relating solely to the enclosure, but they could not, probably, be allowed to vote on affairs connected with life outside.

The chief disabilities under which persons sent to this enclosure would suffer are four: They would be required to be self-supporting—that is, to work or starve; they would have to support, if possible, their families and others dependent upon them; they would be compelled to make restitution, if possible, in whole or in part, to the persons they had injured by their crimes; and they could not leave until the board of penologists —or "social doctors," as I prefer to call them—allowed them to do so.

Now some persons among this community would commit offenses against the laws of the enclosure and against the laws of the state operative there. Such individuals would be tried by their fellow-citizens in courts presided over by a judge chosen from their own number. If the offense committed were a misdemeanor, they would be sent to the jail or village guard house, corresponding to a similar institution on the outside, and if the offense were a felony they would be hanished to the second enclosure.

In this second enclosure the delinquents would find condi-

Outside Boundary Guarded by Society

tions the same as in the first. There would be the same or similar opportunity for work and for normal existence. The only added disability would be that they would be much further removed from the outside world. Restoration to society could come only by passing back through the first enclosure and living their lives there over again.

The method of returning to the first enclosure would not be by satisfying a board of social doctors with their conduct, but by satisfying the inhabitants of the first enclosure, or a committee of them, that they would not commit further offenses or again become undesirable citizens. In other words, they must satisfy the community they had wronged that they are regenerative. The boundaries between the first enclosure and the second would be guarded by the inhabitants of the first.

Crimes committed in the second enclosure would be punished by confinement in the guard-house in that enclosure, or by banishment to the third, and so on. An individual might return from the third to the second enclosure only by vote of the inhabitants of the second, and he must remain there until the inhabitants of the first are willing to have him. Thus each remove from one enclosure to another puts him farther from society. This process would continue, if his offences continued, until he reached the last enclosure. Here, it is safe to assume, only the most incorrigible members of society would arrive. The whole process would be a sifting one, and it might be that it would be best to keep those who filter through to the last enclosure confined there for the rest of their lives.

These people would probably constitute, in part at least, the defectives and all mentally irresponsible, the degenerate and hardened criminal. What should be done with them, whether they should be drawn off and sent to other custodial institutions, or be allowed to live on in the last enclosure in the most comfortable condition possible, is a question that could best be determined after the plan had been in operation and the number to reach this final stage of ostracism observed. Under no circumstances would I give them the same liberty and privilege of self-government as the immates of other enclosures, but would prefer to see them controlled and directed by sympathetic state officials chosen for the purpose.

The definitely feebleminded would in all probability have been discovered long before they reached the final enclosure; indeed, a method for discovering them might well form part of the earlier mechanism of the plan. Whatever is done with them, they should be safely away from the society they seen destined to injure. I should never want to see all hope shut off from them, but should prefer that some provision were always made for letting such of them as gave indications or recovery appeal to the citizens of the adjoining enclosure, or to a body appointed for the purpose, for the privilege of trying once more to live in the society of their fellows. Perhaps it would be desirable to have a second group of social doctors, provided by the state, to control all conditions arising in a special community for the feebleminded.

The life of the village would create its own demand for business and industry. Economic needs would have to be met, just as they have to be met in other communities, and while the industrial and commercial life might have to be simpler because it would be more self-centered, yet the inhabitants could sell their produce and manufactures to the outside world, so that variety would be given to the pursuits, as well as added demand for labor. Trades would be followed very much as anywhere else. Work ought, of course, to be as educative as possible. Every opportunity ought to be given to a man to follow the trade, if any, that he followed on the out-

side. If he had none, then he ought to be allowed to learn one that would enable him to be self-supporting upon release. Agriculture ought to constitute one of the chief industries, because in the wholesome, outdoor work and life of the farm lies one of the chief reformative influences.

Private manufacturers might be induced, if it seemed wise, to locate in the first enclosure, for the sake of the labor supply they would find already existing there. This they could do in the second enclosure also, if the population were large enough to sustain them.

Labor unions could not object to the selling of products in the outside world, provided the inhabitants did not sell below prevailing market rates. Rate-cutting would, indeed, be difficult, if not impossible, because the inhabitants would be subject to the same competitive conditions as any outside worker. They would not be given free board and lodging, free plant and tools, as convict labor in prisons is today. Nor could the competition be justly resented by labor unions, as they now rightly oppose the unfair competition of convict contract labor, because, in the first place, it would not be unfair competition, and in the second place it would not be convict labor. It would be the labor of men who would be none the less citizens, though confined within definite boundaries.

Finally, even if a normal village industry, like that of villages on the outside, proved impracticable, the state could itself erect and operate a system of enclosure industries just as it now operates prison industries. This would have the advantage of having a larger labor supply than prison plants have today, because the law-breaking population of a state is now divided among several penitentiaries.

Critics may say at this point: What a fearful state of anarchy there would be in a community inhabited exclusively by law-breakers! Were the conditions similar to those in prisons, this might be true. With a property basis, however, there is no more likelihood of anarchy in such a community than in any other. Whatever the ethical standards of the inhabitants, those possessing property miside the enclosure would have the same selfish motives for upholding law as property owners outside have. The law-breaker is just as property owners outside have. The law-breaker is just as property owners outside have the first of disturbances should of the most exalted virtue. Moreover, if disturbances should break out, the authorities could call in troops from the outside, just as do the authorities only in any town where an outbreak occurs.

One advantage of this method of handling law-breakers, if it became general, would, I believe, be far-reaching. It is common knowledge that today many law-breakers are never caught. The ratio of the caught to the uncaught is sometimes put as high as 1 to 20. Part of the reason for this is that people know today that when a man is imprisoned the chances are that he is forever ruined—ruined in pures, mind, body and soul. Unless the crime is of a nature to arouse a fury of revenge, few decent people are willing to aid officers of the law in accomplishing his ruin. The average good-natured, kind-hearted citizen is much more apt to help the hunted fugitive than to help his pursuer.

But if conviction for a crime meant not life in a cell-block under a regime of brutality and repression, but life in an open village with every chance for improvement, both in health and habits, and at the same time the social patient be self-supporting, completely or approximately, would not the average citizen feel very differently about the matter? If the knew that the law-bracker, when caught, would be given every chance to develop his best self, and that the door of hope would be forever open before him, would he not aid, in a way that he

has never done before, the detection and punishment of crime? I believe that under such conditions the representatives of the law could reasonably count upon the cooperation of a large percentage of respectable citizens who now wash their hands of what they regard as a sordid and unpleasant business. This would mean that more crimes would be punished than ever before, and since certainty of punishment is a much greater deterrent than severity of punishment, it would mean that society would be better protected and that antisocial acts would diminish. All this is in addition, course, to the diminution that would come from the regenerative effect that the plan would have upon the individual who had already been caught in the law's toils.

If modern penology has taught one thing, it is that responsibility brought home to the mentally competent law-breaker is one of the surest means of reformation. Men and women who break society's laws must be trained in self-discipline and in the responsibilities of citizenship before they can again be allowed to mingle freely with their fellows. Life in these enclosures would constitute just such a centering of responsibility. Every individual there would want to regain his liberty above all things else. To do this he would have to learn to lead a measurably blameless life. In a community of five or ten thousand persons he could not commit oftenses and escape; detection would be certain. Nor, be it remembered, could he regain his liberty by act of his fellows alone, for the board of social doctors would stand between him and society and protect the world outside against the final release of all who are unfit.

This plan would leave untouched and still operative the regenerative principles of probation and suspended sentence. It would combine at once the great principle of the indeterminate sentence, now widely established, and a rational method of life for the lawbreaker. Through it I am convinced that the way lies open for true and progressive prison reform.

### Keeping Mothers and Babies Together

### By Elizabeth S. Walsh

ASSOCIATED WITH THE SUPERVISORS OF THE CITY CHARITIES, BALTIMORE

N the winter of 1916 the report of the Vice Commission of Baltimore [the Survey, May 6, 1916, 157] awakened the general public to the situation of the abandoned child in that city. The best hospitals, for some years, had insisted that the mother and infant be kept together during the woman's confinement and that she leave the hospital with the child. It was always possible, however, by the payment of a moderate sum, to place the child afterwards in an infant asylum, the mother thus relieving herself of its care, and this resulted in the death of the infant in nine cases out of ten.

This "traffic-in-babies" aroused the public to such an extent that Maryland has the honor of having passed the first law forbidding the separation of a mother and infant under six months; except when it is necessary for the physical good of mother or such child that they be separated, this requiring two doctors' certificates or an order from a court of competent jurisdiction or the written consent of the Board of State Aid and Charities. The penalty for violation is a fine of not more than \$100 or imprisonment in jail for not more than 100 days or both; not only for the mother but for any person or institution participating in the separation or a physician who knowingly makes a false certificate.

One of the arguments brought against the law was that it would result in the wholesale abandonment of infants. The statistics do not seem to bear this out. There are no figures available for the state at large, but the Supervisors of City Charities find that the abandoned children received from June, 1915, to June, 1916, numbered 25, and from June, 1916, to June, 1917, but 18. A copy of the law, with a letter asking for their cooperation, was mailed to all of the hospitals, infant asylums, maternities and midwives throughout the state. Shortly after, when a midwife was arrested. charged with violation of the law (she had advertised an infant for adoption), she vehemently urged ignorance as her excuse but, when searched, a copy of it and the letter were found on her person. Needless to say "madam's" feathers fell. Prosecution for violation of the law is carried on through the state's attorney's office. In the case of a good-hearted. kindly, but ignorant, colored or white foster-mother no warrant is issued but she is summoned to this office, the law is read and explained to her, and she is warned that a second offense will mean prosecution,

The law has been in effect since June, 1916, and the institutions feel that it is a good one and have in every instance stood by it loyally. Whenever possible, they have offered a home to the mother with the child. A comparison of the number of children at the infant asylums in the years before and after the law went into effect may be interesting and is as follows:

Infants	received at asylums from June, 1915, to June, 1916,	167
Infants	died at asylums from June, 1915, to June, 1916	113
Infants	received at asylums from June, 1916, to June, 1917	82
Infants	died at asylums from June, 1916, to June, 1917	31

The mortality was thus reduced from 68 per cent to 38

The State Board of Charities, since the law went into effect, have authorized the separation of 12 infants from their mothers; the majority of these upon two doctors certifying to the mothers' mental or physical unfitness. A more rigid investigation of these applications is much to be desired, income instance, one of our most reliable agencies refused to be a party to the separation and yet another social worker carried the matter through, getting the required doctor's certificates without any difficulty. Another separation was authorized because the mother was being held on the charge of abandoning her child and might possibly be sent to the House of Correction; and yet in a parallel case to this, handled by the Supervisors of City Charities, the mother was paroled with her infant and put in the way of supporting herself and child, of which she has since become very fond.

The Supervisors of City Charities say in their report for 1916:

Beginning January I, 1916, a new method for handling white foundlings and abandoned infants was inaugurated, which marks a notable advance in the care of this class of dependents. Up to this inter, foundlings, both white and colored, had been placed by the Supervisors of City Charities in institutions for the care of infants called to the enormous mortality, amounting in some years to praccelled to the enormous mortality, amounting in some years to practically 100 per cent, infants under six months placed in such institutions. After numerous unsatisfactory attempts had been made by this department to improve the method of handling foundlings, an arrangement was faully entered into with the Florence Crittenton

The infants, unless seriously ill, are taken at once to the mission and are given a thorough medical examination by a specialist in children's diseases, including a blood examination to determine whether the infant is infected with any form of communicable disease. The infants are kept in a sanitary nursery under the charge of skilled nurses. They are fed with mother's milk, obtained by a the mission until they are at least one year old, or longer if this is the mission until they are at least one year old, or longer if this is exercised by the department, they are sent at once to the Harriet Lame Hoppital and treated there until they can be sent with safety to the

mission.

The efficient way in which the infants are cared for is shown by
the striking results—the lives of 94 per cent having been saved.

It should be remarked in passing that the one infant which died was born prematurely and was in a dying condition when received. It is questionable whether any other city in the United States has a better record as regards the proportion of foundlings saved than has Baltimore during the year just closed.

In summing up the situation, we might say that broadly the law has been educational in recognizing the rights of the child to a mother's care and love and, therefore, giving it a fighting chance for life, and as a moral tonic to the woman in depening her sense of responsibility and duty towards her infant. In the large majority of cases this thought has never before been presented to the unfortunate girl and when it has been done by a sympathetic social worker, it is not unusual for the mother willingly and cheerfully to accept the situation and keep the child with her permanently.

### Long Distance Social Service

By Renee B. Stern

UR usual idea of a social worker is a person who neets applicants for aid, personally investigates conditions and then does his best to alleviate them. But always we have that idea of personal interview. Yet there are in this country dozens of social workers who each day help many individuals and community groups to work out their own salvation—without ever meeting those they aid. They are seldom classified as social workers by themselves or by others. We can class them all under one name, for by the general public they are addressed as Dear Editor.

If for a moment you doubt that editors and their assistants are social-service workers, take a glance at a day's mail that comes to one of them. Questions of law, directics, child training, abnormal psychology, charity methods and medicine, all come pouring in. Frequent consultations with experts in these lines are maintained. A year ago one of the popular women's magazines listed over twenty-five hundred different topics that had been treated by letter, an astonishingly large percentage of which took up serious life problems, and but a minor representation begged aid of beauty specialists or wanted recipes for fuder.

At first glance we wonder why all these letters are sent to a stranger. There in the word "stranger" lies half the answer. No danger of leakage to family or community when your confidante lives at a distance. Who seems so wise, safe and synapathetic as the editor of your favorite journal?

Just what do these confidential letters ask? Here is one from a farmer's daughter, asking where and how she can get nurse's training. We inquire about her previous education, health and ability to afford time and money for a thorough course, and after a couple of letters have her settled in the right school. Next comes a mother asking how she can educate her gentle little subnormal daughter. They live in one of our largest cities, but are ignorant of the excellent public school classes for subnormal children maintained by their board of education, and are pitifully grateful for information most people would have expected an intelligent mother to find for herself. Then there is the boy, fearful lest he has contracted a disease he is ashamed to tell the local doctor about, who is referred to the medical adviser of the magazine and either helped directly or given courage to see his own physician. Women's clubs ask aid in their program-making or methods of aiding their city; others ask how to organize playgrounds, pageants, civic leagues, little mothers' leagues. A constant flow of letters comes from mothers wanting advice on care of their children: diet; breaking of thumb-sucking, stuttering and other bad habits; club work for boys and girls; books for various ages; handling the adolescent, the defective and immoral; development of attention, concentration, obedience; control of lying, stealing and temper—this list might continue indefinitely.

Pitiful letters from women, asking how to get mother's pensions or earn money to keep the family together are one of the daily tragedies, for many of these women are barred from pension for some reason and are little fitted to wage-earning. Sometimes, after exchange of half a dozen letters. some money-making idea bears fruit or the woman is persuaded to seek the aid of local agencies of which she did not even know until informed by the distant editor.

Questions about marital relations form a goodly proportion of the queries from young married women who, in the process of adjustment in their first married years, feel alone and helpless. Money matters, rights of woman to her own person, drunkenness, cruelty in many aspects and, not infrequently, disagreement over punishment of children, cause these breaches in happiness. The long-distance worker is no more able to help all cases than is the charity worker on the spot, but she frequently gets a frank statement of details that shame would hide in a face-to-face interview, even at times eliciting the reluctant confession that a new love threatens the old. Yes, even that can sometimes be adjusted at long-distance by sympathy, tempered with a bit of common sense advice showing how the new love will in its turn become the old, or call affection for the children to give pause in hasty decision.

As concrete example of results obtained: One magazine in Illinois is responsible for installation of drinking fountains in a Texas town, the gift of the women's clubs; a group of Alaskan women are studying the latest educational theories for the sake of their children; a playground was started in one western town and a pageant given in a North Carolina village; one woman found a child to adopt and another, with a big country home and love of children, was put in touch with placing-out agencies who loan her sick babies to cure.

So it goes, and Dear Editor answers them all, sometimes with aid of lawyer, doctor or minister, but never neglecting a letter, always treating seriously the problems that appear serious to the writer, even into the boy who wants to change the color of his red lairs. When you make up the next social service register, candidly, don't you think that Dear Editor deserves a place therein?

#### SELF-GOVERNMENT IN A COUNTY PRISON

"In reply to our great President's hopeful prayer: 'Let the world be made safe for democracy,' I say: Democracy is safe in East View, N. Y."

It is not important that the speaker of these words was not a citizen in a legal sense. Neither is it important that he was a native of Germany. The important thing is that he had just been elected first president of the first selfgovernment organization to be established in a county penitentiary in this country.

Weeks ago, Calvin Derrick, warden of the Westchester County Penitentiary at East View, told the inmates of that prison that they could form a limited self-government league if they wanted to and if they themselves could work out the scheme of organization. Leaders among the prisoners immediately began to agitate the subject. They found different views among their fellows and decided to conduct an educational cam-Mass meetings were held at paign. which the arguments for self-government were presented and opinion was finally crystallized in favor of it. A committee of prisoners was thereupon chosen to draw up a constitution. After some parleying, a draft was finally reached that satisfied both inmates and warden.

This constitution differs in one important respect from both the Sing Sing and the Ione, Cal., plans-the prisoners' court has no punitive powers. This arrangement was the desire of the men themselves. The court is called the Inmates Court for the Establishment of Good Relationship and consists of the judge, who presides, and is elected by all the members for a period of four months, and of two jurors. The jurors are the vice-president and a delegate chosen by his fellow delegates for this purpose. The court tries all offenders who are members of the league. A ver-dict is rendered in the form of "guilty of having broken good relationship with the league," and it then becomes the

duty of the court to try to establish good relationship by "counsel, advice and reprimand."

If good relationship cannot be established, or if the offense is so serious that it does not warrant the "expectation of establishment of good relationship," the offender may be expelled from the league indefinitely. This means that he comes under the control of the county and that Warden Derrick becomes his disciplinarian. An inmate twice expelled can never again be a member of the league, Applications for reinstatement of a member may come from the warden only.

The name of the league is the Effort League, signifying "struggle for better citizenship, nobler character and higher morals." Each incoming prisoner who takes a simple pledge to uphold the rules of the institution becomes a member automatically. It has been agreed, informally, however, that insane persons shall not be allowed to be members, and five prisoners are debarred on this ground at present. The officers-president, vice-president, judge, secretary, sergeantat-arms and public defender-constitute the cabinet and are subject to recall when impeachment proceedings have shown their unfitness for office. Each tier elects a delegate who sits on the board of delegates. The public defender, elected by the whole body of prisoners, must defend all cases brought before the court. The warden is an honorary president of the league and is invested with vetoing and pardoning powers.

#### TRAINING FOR THE THREE H'S IN EUROPE

WHEN former Governor Glynn declared several years ago, at the inauguration of John H. Finley as commissioner of education for New York state, that the cultivation of the three R's in American education ought to be supplanted by the cultivation of the three H's-head, heart and hand-he was only foretelling apparently a development that was destined to receive great impetus as a result of the European war. The demand for vocational and industrial education has grown tremendously in nearly all European countries. The United States Bureau of Education has just brought together information concerning this movement in a small bulletin.

As the bulletin was going to press, a cablegram from England announced that the bill promised by the president of the Board of Education had been presented to the House of Commons and would be taken up in October. This measure embodies the broadest conception of popular education ever presented for the approval of Parliament. If it becomes law, school attendance will be compulsory for all children up to the age of fourteen years and all exemptions will be abolished. Local education authorities will be obliged to provide suitable continuation classes for children up to sixteen or seventeen years, children not otherwise in school will be required to attend these classes for a specified number of hours, and employers will be obliged to make it possible for them to do so. The report of the government committee on continuation schools, which foreshadowed this legislation, was summarized on page 384 of the SURVEY for August 4.

France and England seem to have reached about the same stage of progress toward a national system of continued education. At present the opportunities offered by private societies in France are such that only the most ambitious working people, and these not until the pressure of daily labor has aroused them to

#### SOCIAL PUBLICITY

THE cover of an announcement of a regional conference of the National Association for the Study and Prevention of Tuberulosis, carried out similarly for the other districts. The outlines of the state, the star for the conference city, the name of the state and the calendar are in dark blue, the remainder in a bright, splashy red. Information about the conference and the program are on the inside. Folded thries for maining, the dimensions are 9 by 4 inches.

efforts to improve their condition, can take advantage of them. A bill is now pending before the Chamber of Deputies, sponsored by M. Viviani, former minister of public instruction, which establishes the principle of compulsory education in continuation schools at public expense. It applies to boys who do not attend the secondary schools up to the age of twenty years, and to girls up to the age of continuation of the property of the property

The term of compulsory education for adolescents is divided by this bill into two periods. The first extends to the age of seventeen for boys and sixteen for girls. During this period physical training, French language, history and geography, and lessons in the sciences ap-

plied to agricultural industry, commerce, navigation, or domestic economy are obligatory. The minimum duration of these courses is 50 hours a year for general education, 150 hours for technical training, and 100 hours for physical training.

The second period covers the ages of seventeen to twenty for boys and six-teen to eighteen for girls. The obligatory subjects are: for boys—lessons in the French language, history, geography, civies, common low and political economy, and gymnastics, military exercises and rifle firing; for girls—French language, history, geography and domestic economy, and manual work and practical exercises in hygiene and care of the sick and of infants. The minimum dura-

tion of the instruction in this period is 100 hours a year.

Regarding Russia, the bulletin says there are many indications that the education of the masses for intelligent citizenship and industrial efficiency will be the chief concern of local and central authorities as soon as normal conditions are restored. In Poland, the prospect of national independence has at once led to a great revival in educational enthusiasm. The bulletin mentions that in the temporary lull of military events in 1915 the citizens of Warsaw established forty-nine industrial continuation schools.

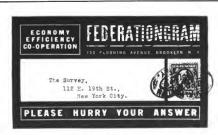

Nothing is given in the bulletin concerning recent developments in Germany. The highly developed system of continuation schools in that country has, of course, been severely criticized as being too narrowly industrial. Attendance upon these schools is now compulsory in fourteen of the twenty-six states of the German empire. It may be compulsory according to local option in ten others and the four remaining states, declares the bulletin, are ready to adopt the principle.

#### MAKING GARDENS SAFE FOR VEGETABLES

AST spring Massachusetts social workers were anxious lest the increase in home gardens, all over the state, should incite a flood of mischief or petty thievery, and perhaps provoke severe treatment of juvenile offenders by the courts, or even a crop of legislation antagonistic to the juvenile court and probation system. As a preventive measure, representations were made to the State Committee on Public Safety, which promptly appointed a special Committee on Garden Protection. A campaign to make respect for gardens a mark of war-time lovalty was at once undertaken. Posters and newspaper articles distributed the message widely, supplemented by talks in the public schools and by the efforts of boys' clubs and the boy scouts.

At the end of the garden and fruit season, the Massachusetts committee now reports that the injury to gardens, both mischievous and malicious, has been extremely small. Through local safety committees, probation officers, special correspondents and newspaper clippings, the committee has sought to be informed of every instance of depredation and has followed up reported cases for full information. The total damage is almost urgligible and the number of even annoving instances is extremely small.

Credit is given the effort of the schools to impress upon children the duty of respect for property, the general patriotic appeal and the efforts of the police to bring every offense to the attention of the courts. With greatly increased numbers of gardens and their exposure

#### SOCIAL PUBLICITY

PRINTED in dark blue, this envelope for the appeals of the Brooklyn Federation of Jewish Charities has much the appearance and something of the urgency of a telegram. It is reported a success.

to possible harm, there is believed to have been a positive decline in the extent of miscreancy. Extreme or unusual penalties have been used by very few courts. The facts are believed by the committee to offer no warrant for variation from the policy of dealing with offenders, particularly with juveniles, by probation and instruction rather than by severity of punishment,

#### SOCIAL HYGIENE SOCIETY FOR TEXAS

OLLOWING the clearing of red FOLLOWING the creating and the great cities near the army camps and the great public interest in social hygiene aroused by the new situation, a conference of delegates from the principal cities of Texas at Dallas last week formed a state social hygiene association. The convener of the meeting, Dr. A. I. Folsom, chairman of an organization committee from the State Medical Association, was elected president.

Several of the speakers presented facts showing the grave danger of the social disease to the health of the state. The medical profession especially showed itself fully aroused to the need of action. According to Dr. E. H. Cary, president of the medical association, the presence, soon, of some 200,000 soldiers in Texas will provide a unique opportunity for the different authorities and organizations interested to stamp out venereal

diseases by joint endeavor.

Col. George A. Skinner, in charge of the base hospital at Fort Sam Houston, said that of 800 patients now in the hospital under his control, 300 were acute cases of venereal disease. "It is all right to educate people," he said, "but immediate action is necessary. You talk of protecting the boys at the front, but don't forget the girls at home. The work of this organization is immediately and seriously necessary in Texas-the problem of the boys at the front comes later."

#### PUBLIC RECREATION AND TRAINING CAMPS

HE soldiers complain of extortionate prices on the part of the townspeople, and the civil population is irritated by the misconduct of soldiers," a correspondent reports. But already grievance or adjustment committees have been organized where such abuses occurred to straighten them out.

More important, experienced workers who are organizing a wholesome contact between soldiers and townspeople on the lines described by Joseph Lee in the SURVEY for October 6, find that wholesome recreation, properly intro-duced, promises splendid and lasting effects on the recreational life of the community itself. Thus, Roy Smith Wallace, who in peace times is executive secretary of the Philadelphia Society to

### Christmas Handkerchiefs

### Mc Cutcheon's Fifth Ave. & 34th St., N. Y. City

T is none too early to be thinking about Holiday Handkerchiefs, and especially if you wish embroidering done,

We are fortunate in having been able to secure so many kinds and varieties of Handkerchiefs this year and such an ample supply. There are many new embroideries and other novelties, as well as all the more familiar kinds. The range of choice is unlimited. All pure Linen, of course. We have stuck to that principle for sixty-five years and we stick to it still. There is no cotton in the whole stock: that's an important thing in these days when ascending costs tempt manufacturers and dealers to cut quality. For a Man: Splendid, luxurious Linen Handkerchiefs of full size, 25c, 35c, 40c, 50c to \$6.00 each. Initialed at 25c, 35c, 50c, 75c and \$1.00 each. Smaller sizes 50c and up, with or without initial.

For a Woman: Everything from simple, plain hemstitched ones at 15c, up to elaborate affairs of Duchesse Lace or Embroidery at \$50.

For a Child: Pretty little embroidered and print designs in color as well as all White, 15c each and up.

We have the usual large collection of White Embroidered goods from Ireland, Switzerland, Spain, Madeira, etc., at the popular prices, 25c, 50c, 75c and \$1.00.

All the way through, the collection is just as wide and interesting

NOTE-If it is desired to have Initials, Monograms, etc., embroidered to order, no time should be lost in placing orders to insure satisfactory work and delivery before Christmas.

Handkerchief purchases are delivered in dainty White boxes suitable for presentation as Christmas gifts.

Orders by Mail Given Special Attention.

Protect Children from Cruelty and who spent all last summer in the Southwest, where he was in charge of community organization work in the cities and towns around seven new training camps and eleven border posts, with his assistants and with the aid of local workers, was able to bring about a complete transformation of popular amusements.

Not only did the civil and military licensing authorities make good use of their censorship over commercial amusements and allowed nothing of an obscene character, not only was the finan-

cial inducement of keeping near the town the camps which bring into them millions of dollars of business used to make the citizens keen on the maintenance of the high standards required by the War Department; but in addition considerable success was obtained in attracting the right kind of entertainment.

Theaters, moving pictures, carnivals, circuses, wild-west shows, electric parks. swimming pools were organized or induced to come to these towns. Where previously the saloons and the poolrooms shared between them the bulk of

the recreational expenditures of the people, they have now to compete with numerous counter-attractions. Churches. young people's societies, fraternal orders, women's clubs and business organizations have been shown how to provide desirable attractions; they have absorbed not only large numbers of the welcome strangers in uniform but secured a better hold over their native clientele.

#### CONCERNING CHAPERONES IN A MINING TOWN

"W HERE can the young boy or girl go who wants to learn or enjoys dancing?" Rabbi Emanuel J. Jack, until recently president of the Board of Public Welfare at Pueblo, Col., asked himself when many complaints reached him concerning the management of the dance halls in the town. So he went around himself and visited the places where the Colorado Fuel and Iron Company's population of immigrant steel workers and their families learned that one popular product of American native art, the ragtime dance.

On the whole, there was not much wrong with the way in which these public dances were conducted, and the behavior was no more boisterous than youth demands, or familiarity more intimate than the modern dance demands. Rules of decency were not violated, though standards beyond a certain minimum of decorum varied considerably. The so-called moonlight dance during which the lights are turned off or dimmed, seems to have been a novelty to the investigator who also noticed that the particular hall which offered this form of entertainment was particularly popular with the "younger set."

The upshot of these visits was a strong recommendation to provide an age limit for all public dance halls "but not until we have provided other means for the young boys and girls who are old enough to work hard in shop or store all day but not of age to attend public dances at night." Pueblo is now erecting a magnificent new municipal building, and the Board of Public Welfare has been assured that a municipal dance hall will be provided for in the plans. But with this they are not satisfied. They strongly urge that the school buildings, now unused for the greater part of the time, be opened for social meetings and for dances to those youthful debutants and debutantes whom proper regulations would exclude from the public dance halls.

### ARMENIANS AND SYRIANS IN EVER WORSE PLIGHT

PRESIDENT WILSON on Saturday issued a second appeal-following one made a year ago in compliance with a resolution of Congress-for the relief of the valiant Christian nations of Asia Minor whose suffering from the social and economic effects of war and from misgovernment is acute. "Reports indicate that of orphans alone there are more than 400,000," says the presidential message, "besides women and other dependent children, reaching a total of more than 2,000,000 destitute survivors."

The Armenian sufferers from Turkish oppression flee as far as they can get. and appeals for their relief are received by the American Committee for Armenian and Syrian Relief from places in Russia and Persia which are far from their homes. From one Turkish city it is reported that, after deporting all Armenian residents and treating them with the utmost cruelty, the authorities suddenly realized that they had driven away the majority of their industrious artisans and that they were in a serious predicament for lack of indispensable services. Hence they started to offer bribes to the deportees in the vain hope of inducing them to return!

"Famine increasing," says a cable received last week from Tabriz. "Wheat six dollars bushel. People dying at our gate of hunger. Many will die of cold without clothes or bedding. Forty thousand Christian refugees and as many Kurds." The rise in prices has now become a matter of grave anxiety to the relief agents in the different centers. It vastly increases the number of those who fall into destitution after having remained self-supporting for long in spite of the greatest hardships-this is especially true of the Syrian refugees in Mesopotamia-and it continually decreases the purchasing power of the available relief funds.

The mayors of a number of cities have designated November 10-11 as Armenian-Syrian relief days.

#### THE COPPER SETTLEMENT IN ARIZONA

S MALL opportunity appears to have been left for the I. W. W. to gain the ascendancy in the Globe-Miami district in Arizona, where President Wilson's Mediation Commission has scored its first victory by settling the strike which has been in progress since last July. The terms of the agreement call for the re-employment of all strikers except those who have indulged in seditious utterances, and "those who have membership in an organization that does not recognize the obligation of contracts."

The first result of the direct intervention by President Wilson in industrial unrest, through the commission of which Secretary Wilson is the head, became known on October 23, when it was announced that work would be resumed "by the single most important copper center in Arizona, if not in the United States." The normal monthly

### THE BEST FALL FICTION

### A First Novel of Amazing Power

### HELEN OF FOUR GATES

The author of this extraordinary "first book" is referred to as one of the most remarkable writers of recent year.

The Dial says: "The qualities I like best in the story are qualities that are not modern—that make a story, whether it is a year or a hundred years old, live in our memories for its truth and its humor and its imagination, that give it pulgrancy and distinction."

The New York Times says: "Has brought a new note to current fiction, a note that excels in sheer emotional power, in beauty of tone, in languination any voice that is now telling stories to the English-speaking peoples." New York World says: "There are in print few pictures more impressive than those drawn by this unknown author."

### THE ENLIGHTENMENT OF PAULINA

BY ELLEN WILKINS TOMPKINS, author of "The Egotistical I." Net \$1.50 When a woman marries for his money a man whom she despises and then suddenly finds herself the wife of a penniless criminal she has to face moral as well as social readjustments. Here is a vital, sincere study of modern American life and the soul-growth of a self-righteous, self-seeking woman who came to understand by mingling closely in the home life of a small Southern town what human nature and loving-kindness mean.

### GONE TO EARTH

BY MARY WEBB, author of "The Golden Arrow."

Net \$1.50
The New York Post says: "Fidelity to nature that marks the early character description of Gone to Earth and the mingling of humor and beauty in the novel is rarely well done. The picture of the balf gypsy girl with tawny hair and the feet of a born dancer, with her pet fox and her kinduess to all things; the sketch of the abstracted, callous old harper with whom she has no tie but one of blood will not be forgotten easily."

THE JOYFUL YEARS
BY F. T. WAWN Net \$1.50
Philadelphia Press says: "This is the love story of Cynthia and Peter, a beautiful story and beautifuly told. There are other people in the book whom we should like to meet, but these only form a background for the radiant figures of the young lovers."

### MY WIFE

BY EDWARD BURKE Net \$1.50 A story of family life narrated by the husband and father in which he almost succeeds in complicating two love affairs beyond remedy and has a narrow esglast of an old fascination. It is written in a breezy style and its satire is unsparing.

THE MASTER OF THE HILLS
BY SARAH JOHNSON COCKE
Richmond Times Dispatch says: "Mrs. Cocke reveals
exceptional literacy and dramatic ability and her interpretation of the thoughts and characters of the pure-blooded Americans of the Virginia and Georgia mountain regions reveals an insight that is remarkable for its depth of feeling and discovering beautiful traits of character."

#### THE ROYAL OUTLAW

BY CHARLES B. HUDSON Net \$1.50 A wonderful tale of fighting men laid in the time of King David. Not since Ben Hur has such a novel appeared. New York Tribune; "No person can read this book without gaining a clearer understanding of those times and without being charmed with the vital human interest of the tale."

#### DAY AND NIGHT STORIES

BY ALGERNON BLACKWOOD Net \$1.50 Author of "The Wave," "Julius Le Vallon" New York Times says: From gay to grave, from

horror to sarcasm, from philosophy to the most fanci-ful extravagance they range. They are the production of a man who sees with the eyes and writes with the sense of rhythm and of beauty of the born poet."

#### WILLIAM BY THE GRACE OF GOD

BY MARJORIE BOWEN Net 81.50

New York Times says: "Few events in history are more inspiring than the brave fight of the Netherlands against the mighty power of Spain with the victory at last won through the courage defeat could not quell, and few figures are as gallant as is that of William by the Grace of God."

### The First Entirely True Book

Yet Written About the World War, as Terribly True as Verestchagin's Paintings

### UNDER FIRE

(FIFTH AMERICAN EDITION IN PRESS) Translated from the French (Le Feu) by Fitzwater Wray BY HENRI BARBUSSE

The leader of a squad in the French Army tells the story of its daily life with all the details that English and American writers suppress or gloss over.

The New Republic.—"This novel is epic in proportions. It reduces Mr. Britling's intellectual reactions to insignifi-

cance." The Nation.—"The greatest of the books that voice the new soul of France. The strongest and grimmest book yet

written about the war. The London Observer,-"The supreme novel of the war. The rich variety of the book is Indescribable. If any bank could kill war, this is that book."

"Under Fire" is not only the most mercllessly truthful and the most appalling book yet written about the war, it is also the most humorous and the most human. It has

output of the Globe-Miami district is said to be about 21,000,000 pounds of copper, requiring a working force of over 5,000 men.

According to a statement given out by the commission, it proceeded in its labors upon the principle that the country must have an uninterrupted output of copper during the war and that there must be no stoppage of work on account of any sort of grievance. To avoid that, practical machinery must be devised for the adjustment of grievance.

Accordingly, the contending parties in the Globe-Miami district were induced to resume work on the following basis: The appointment of a committee at each mine consisting of working miners, for the purpose of dealing with the employers in the matter of grievances; the reemployment of all strikers, excepting "those guilty of seditious utterances against the United States, or those who have membership in an organization that does not recognize the obligation of contracts"; the appointment of an arbitrator representing the government, who is to settle all disputed questions of fact.
"The machinery thus provided," says
the statement, "is in substitution for strikes and lock-outs during the period of the war."

After settling the trouble in the Globe-Miami district, the commission proceeded to take up the difficulties in the neighboring Clifton-Morenci-Metcalf district.

### CIVIL LIBERTIES IN WAR

The Civil Liberties Bureau of the American Union Against Militarism, has become an independent agency under the new name of the National Civil Liberties Bureau, with headquarters at 70 Fifth avenue, New York city, and a Washington office in the Munsey building. The bureau retains the same staff of 150 cooperating attorneys throughout the country.

The bureau secures legal aid wherever constitutional rights are violated under pressure of war. Reports of cases are secured through a clipping service and correspondents in leading cities. Legal references and briefs are pre-pared to aid the attorneys. Test cases are being brought through the courts to determine the validity of certain wartime legislation restrictive of constitutional liberties. Complete records are being collected of all war-time measures and cases in order to provide an effective basis for further protecting constitutional rights after the war is over. Active cooperation is maintained with national and local organizations of the radical and liberal groups. The bureau is also endeavoring to secure a satisfactory solution of the problem of the conscientious objector, in cooperation with religious and liberal organizations.

The bureau quotes Lord Parmoor's recent statement in the House of Lords as illustrative of its underlying purpose: "The supreme test of civil liberty is the determination to protect an unpopular minority in a time of national excite-ment." The bureau holds that "the rights of minorities in a democracy are as fundamental as those of majorities and as necessary to the preservation of the democratic principle."

While the bureau is active chiefly in behalf of persons, organizations and publications which are working for peace, and for the conscientious objector, it announces that it is not adopting a policy of obstruction or attempting to embarrass the government in any way-"it stands for the preservation of constitutional rights on general principle in the interest of democratic institutions" -and its work is done in close cooperation with government officials both local and federal.

The director of the bureau is Roger N. Baldwin, formerly of St. Louis, who resigned his position as secretary of the Civic League last April to join the staff of the American Union Against Mili-tarism as a volunteer. The directing committee is composed of L. Hollingsworth Wood, chairman, Norman M. Thomas, vice-chairman; Helen Phelps Stokes, treasurer; Walter R. Nelles, counsel; Albert de Silver, John Lovejoy Elliott, Edmund C. Evans, John Haynes Holmes, Agnes Brown Leach and Amos Pinchot. Its Washington representative is Laurence Todd.

### THE BOY AND THE GREEN **GARY FROG**

ONE of the advantages of the work-study-play program of the Gary public school, which is now spreading in many American cities, and has become a political issue in New York city. is that it allows teachers greater freedom in disposing of the time of their classes. Teachers have used this freedom variously. How she used it to make nature study more real, and the resulting encounter between a boy and a frog, is told by Sara Crystal Breslow, a teacher in Public School 45, the Bronx, New York city:

It would have been impossible to accom-plish under the old plan what I did. In the plish under the old plan what I did. In the old school only twenty minutes were given to nature study. Under the Gary system the children have eighty minutes a day for thirteen weeks. I was able to take them on excursions into the fields and the parks, and to follow up in the classroom what they had learned there. As a result of these ex-cursions, children who didn't like school, not only came to like but actually wouldn't

go anywhere else.

I remember one very unmanageable boy
who said when put into my class: "I'm not
coming to school tomorrow."
"That's all right," I said, "neither are we."

FOOD

**FACTS** 

The METROPOLITAN LIFE INSURANCE COMPANY announces the publication of a new booklet—

## FOOD FACTS

The following table of contents indicates its scope:

CHAPTER I.—Where to Buy.
CHAPTER II.—How to Buy Cheaply.
CHAPTER III.—Clean Food and Disease Prevention.
CHAPTER IV.—Wise Food and Health.
CHAPTER V.—Cooking Foods.
CHAPTER VI.—Good Food Habits.

In this booklet Dr. Donald B. Armstrong, the author, brings out in simple language the fundamental facts in regard to the purchase, preparation and use of foods.

This publication is a contribution on the part of the Company to the present war preparation of the Country. Individual copies or limited supplies may be secured without cost from the Metropolitan Representative in your city or by application to the

Monthly salary \$30 for first year, with hours off and week-end every five weeks, vacation of three weeks first summer, after that raise in salary and longer vacation. Address 2645 Survey.

### THE BOY AND THE GREEN GARY FROG

(Continued from page 131)

"Goin' to play hookey?" he asked. "Something like that," I said.

Then I told him that all the class were to meet at the gate the next morning and to go out into the country. He was there with the others, interested but still mischievous. We passed a pond shortly and I heard him calling me.

"You see this frog?" he said. do tricks! I picked him out of the water the water he was brown with green spots on him, but when I put him in the grass

he was all green." That boy had discovered for himself the ossibilities of protective coloring; and after that he was all eagerness to learn

The first time the district superintendent came, I was told that he expected the children to speak for twenty minutes on any subject that had been taught. I didn't know if my children could do that or not, for I hadn't drilled them so much in expression as in impression. But even I was surprised to see how much they were able to express. Every boy in that class was alive with interest over some experiment he had made or some plant that he wanted to tell about.

My children know the why and wherefore of all their movements. Any teacher should appreciate that. The isolation of the class-room is broken up. The whole world has room is proken up. The whole world has become a laboratory for the child, and the classroom a place to which he can return, just as you do to your desk, to tabulate what he has gaybeard. he has gathered. My excursions made the child's brain more alert; they brought him into such a mood that he could concentrate upon whatever he was learning.

# MAZDA

MAZDA Service

—a systematic research for making lamps more
economical

THE MEANING OF MAZDA -

MAZDA is the trademark of a world-wide service to certain lamp manufacturers. Its purpose is to collect and select scientific and practical information concerning progress and developments in the art of incandescent lamp manufacturing and to distribute this information to the companies entitled to receive this Service.

MAZDA Service is centered in the Research Laboratories of the General Electric Company at Schenectady. The mar'l MAZDA can appear only on lamps which meet the standards of MAZDA Service. It is thus an assurance of quality. This trademark is the property of the General Electric Company.

# Through Liberty to World Peace

### First Congress of the League of Small and Subject Nationalities

N event took place in New York last week which may live in the text-books of history long after the week's "exits and alarums" of the military incidents in Europe have been relegated into the undated, generalized background of the recorded happenings. The first congress of the League of Small and Subject Nationalities, attended for three afternoons and evenings by representatives of more than twenty different nationalities and many Americans, opened an era of international cooperation for a purpose new in immediate practical aim but age-old in aspiration. Its discussions ranged from questions of tariffs to those of inalienable human rights. Those who participated for the most part were plain folks; but there were also leaders in practically every profession-jurists, clergymen journalists, teachers, doctors, political leaders, soldiers, social workers. There were, among others, Belgians, Danes, Finns, Lithuanians, Letts, Koreans, Jews, Chinese, Albanians, Hindus, Poles, Greeks, Irishmen, Norwegians, Negroes, Boers, Swiss, Scotsmen, Swedes and Syrians.

A number of circumstances might have handicapped the success of the congress. First among them stands the hostile attitude of many Americans at the present time to the discussion of any questions of international policy not immediately related to the successful prosecution of the war. This was responsible, among other things, for a deliberate attempt by a part of the metropolitan press to belittle and even to malign the motives of the organizers and to seek for pro-German sentiments in speeches and statements which were transparently free from them. Letters of resignation from obscure individuals-mostly written under some misapprehension subsequently dispersed-were printed in extenso, while no mention was made of the presence and participation in the congress of men enjoying national and international reputations, such as Senator Henri La Fontaine, of Belgium; Samuel T. Dutton, secretary of the World's Court League; Moorfield Storey, president of the American Bar Association; Hamilton Holt, vice-chairman of the League to Enforce Peace, just to mention a few. The coincidence of the congress with a municipal election and other public events of absorbing interest was another handicap.

There were also, of course, some jealousies and suspicions

such as are characteristic of any representative international gathering at which vital problems are under discussion. Thus, the split between the two parties of Greeks in this country, which already had shown itself at the Long Beach conference on international relationships a few months ago, again led to an open breach. But, in spite of such incidents, partly owing to a sincere endeavor of the congress committee to invite representatives of the different factions where such were known to exist, there was much less disturbance from this source than might have been expected. Indeed, the most remarkable phenomenon of the congress was its unanimity on all matters of importance; and this was not due to any censoring of expression or selection of speakers known for views shared by the promoters, but to the fact that every one of the score of addresses delivered dealt with fundamentals and, through being constructive, was needs also conciliatory in tone.

It might have been thought unfortunate that by including in the list of speakers and members of the council representatives of nationalities subject to allied powers the question of patriotism was raised. A number of members, including the representatives of Alsace, Norway and all the various Slavic nationalities, sent in their resignations on that account. But since nearly the whole of the inhabited world is now allied in fighting Germany, it is a matter of course that there are more races and nationalities subject to the allies than to the Teuronic powers. If Ireland, Korea, Finland, India, Lithuania and Russian Poland had been excluded from participation, the congress would have completely failed in its purpose; for the league could then not have pretended to represent the common opinions and sentiments of small and subject nationalities.

Even the gentleman from Scotland, chief of Clann Fhearguis of Stra-Chur, a picturesque figure in Highland attire, whose inclusion in the council was instanced by some critics as an undesirable excursion into history, detracting from the urgent claims of the present, if not a deliberate attack upon our British ally, overcame that opposition by making out a remarkably good case for the separate representation of his country at future international conferences. Even if one did not share all their pretensions, one felt convinced that the exclusion of the different home-rule movements under the case for Belgium, said his country had shown to the world that free trade is the true principle of international exchange. "Let all small nations defend that principle. Free circulation of man is another elementary principle for which we must stand. Grotius and the other fathers of modern international law in the seventeenth century looked upon it as a condition of world bease."

Complete liberty of speech and teaching in every country, going to the extent of allowing any nationality or religious denomination to establish and maintain schools in any country where it desires to have them, was agreed upon as a third seasttial condition of real world democracy. This view was urged more especially by Ivan Konigsberg, who spoke on behalf of Sleswig, and by the chief of Clam Fhearphus of Stra-Chur. "This conference," said Mr. Howe, "believes that all people should be protected in the enjoyment of their religion; that they should be encouraged to develop their cultural life, as well as the contributions which they can make to the civilizations of the world."

Finally, it was clear from the beginning of the congress that the league, in order to exert an influence in favor of self-government and economic and cultural freedom, must unite on a policy of world federation embodying basic human and national rights. It must stand for a practicable policy of securing and maintaining the peace of the world. Here the knowledge of Senator La Fontaine, the great international jurist, who as chairman of the committee on resolutions notably contributed to the success of the congress, guided it with much skill over danaerous pitfalls. "The small nations must have a

program," he said, "which it will be to the interest of the big nations to accept. The peoples everywhere want to get rid of war. Let us unite, then, on a program which will ensure world peace." In the formulation of this, he warned against the adoption of half measures which might widen the gulf between contending groups of nations into one between continents. "We must organize on lines similar to those of the United States of America, a world federation including large and small states. For the settlement of disputes we need a court in which all of them will have complete confidence, though it need not and practically cannot consist of elected representatives of all."

The Congress of Small and Subject Nationalities has spoken. It asserts the right of every nationality to separate representation at international conferences. But it also demands to be heard as a body representing hundreds of millions of common people the world over in their most cherished hopes, in their deepest convictions. It is imbued with the spirit of democracy, of brotherhood. Black and white, Jew and Gentile, Protestant and Catholic, have deliberated together how peace might be restored to the world and how it might be secured forever against wanton aggression. In the words of the preamble to one of their unanimous resolutions: "The future progress and happiness of mankind depend upon the establishment of harmonious relations between the different peoples of the world; and such harmonious relations can only exist after each nation is made secure in the enjoyment of its political and economic freedom."

B. L.

### WHEN THERE IS PEACE

By Austin Dobson

"When there is Peace our land no more Will be the land we knew of yore."

THUS do our facile seers foretell
The truth that none can buy or sell
And e'en the wisest must ignore:
When we have bled at every pore,
Shall we still strive for gear and store?
Will it be Heaven? Will it be Hell,
When there is Peace?

This let us pray for, this implore:
That all base dreams thrust out of door,
We may in loftier aims excel
And, like men waking from a spell,
Grow stronger, nobler, than before,
When there is Peace?

# The Negro's Fatherland

By W. E. B. Du Bois

DIRECTOR OF PUBLICATIONS AND RESEABCH, NATIONAL ASSOCIATION POR THE ADVANCEMENT OF COLORED PEOPLE

HE future of Africa is one of the most important questions to be answered after this war. The very silence today concerning that future, on both sides of the forces at war, emphasizes its importance. We must remember that in Africa we have today not only the greatest world mine of undeveloped human labor but, also, that much of the raw material which the modern world particularly wants is to be found in Africa more abundantly than anywhere else. Let us note the list: Palm-oil, cocoa, mahogany, ebony, cork, cotton, rubber, ivory, ostrich feathers, gold, copper, iron, zinc, tin, lead and diamonds,-these are the present gifts of Africa to the world. Others in abundance hide in her bosom. The fight for the ownership of these materials and the domination of this labor was a prime cause of the present war. If this question is to be left unsettled after this war it is going to be a prime cause of future wars.

Why, then, are we so silent concerning the fare of something between 150,000,000 and 200,000,000 human beings? I presume that the cause of our indifference is largely psychological. It is the penalty of human degradation which always exacts payment from oppressor and oppressed. Today it is possible to ignore the Negro because of a history of degradation the parallel of which the modern world does not furnish. In ancient Mediterranean civilization Negro blood was predominant in many great nations and present in nearly all. Negro genius and Negro civilization gave here their great gifts to the world. In the European middle age when Africa became more or less separated from direct contact with Europe, nevertheless, African culture filtered into Europe, and legend and story and song came out of the dark continent. There was then no question of racial inferiority based upon color. But then, beginning late in the fifteenth century, the world for four hundred years raped this continent on a scale never before equalled. The result was not only the degradation of Africa, it was a moral degradation of those who were guilty; and we are still living in the shadow of the debauch of the African slave trade. It comes natural for us to have great masses of unthought-of men; to conceive of society as built upon an unsocial mudsill. It is possible for great labor organizations like the American Federation of Labor to organize themselves upon distinctly aristocratic lines, leaving out of account and out of thought certain so-called lower elements of labor. It is even possible for an organization like the League of Small and Subject Nationalities to bring in Africa only as an accident and after-thought. This mental attitude toward Africa and its problems builds itself upon unclear thinking based on the tyranny of conventional words.

When we speak of modern African slavery, we think of modern slavery as a survival of ancient slavery. But it was not. The cleft between the two was absolute. Modern African slavery was the beginning of the modern labor problem, and must be looked at and interpreted from that point of view unless we would lose ourselves in an altogether false analogy. Modern world commerce, modern imperialism, the modern factory system and the modern labor problem began with the African slave trade. The first modern method of securing labor on a wide commercial scale and primarily for profit was inaugurated in the middle of the fitteenth century and in the commerce between Africa and America. Through the slave trade Africa lost at least 100,000,000 human beings, with all the attendant misery and economic and social distributions. The survivors of this wholesale rape became a great international laboring force in America on which the modern capitalistic movement has been built and out of which modern labor problems have arisen. We have tried ever since to keep these black men and their descendants at the bottom of the scale on the theory that they were not throughly men, that they cannot be self-respecting members of and contributors to modern culture—an assumption purely modern and undreamed of in ancient or medieval days.

If, now, this same psychology and this same determination to exploit and enalave these people passes over into the new world after the war, what can we expect but, on the one hand, persistence of the idea that there must be an exploited class at the bottom of civilization and, on the other, an endeavor by endless war and rapine, futile at first but in the end bound to be triumphant, by which these millions of people will gain their right to think and act. No modern world can dream of holding 200,000,000 of people in permanent slavery even though they be black. If it tries, the cost will be terrible. If we would avoid this cost then we must begin the freeing of Africa through this war.

There is an unusual opportunity to do this. Africa is today held by Negro troops trained under European white officers. These Negro troops have saved France. They have conquered German Africa. They and their American Negro brothers are helping to save Belgium. It would be the least that Europe could do in return and some faint reparation for the terrible world history between 1441 and 1861 to see that a great free central African state is erected out of German East Africa and the Belgian Congo. Surely after Belgium has suffered almost as much from Germany as Africa has suffered from her, she ought to be willing to give up the Congo to this end; and it would be right that England should refrain from taking German East Africa as well as refrain from handing it back. Out of this state we could make a great modern effort to restore the ancient efficiency of the land that gave the iron age to all the world, and that for ages led in agriculture, weaving, metal working, and the traffic of the market place. Here is a chance such as the world has not seen since the fifteenth century. Liberia and Haiti were never given a sincere chance and were from first to last harassed, as only modern capitalism can harass little and hated nations.

The effort of such a new and sincere start in Africa would be tremendous. Its first effect would be upon the millions of Africa and then upon their descendants throughout the world. In the West Indies and in South America are some 30,000,000 of men of Negro descent. They have given literature and freedom to Brazil; they have given industry and romance to the West Indies, and they have given to North America art and music and human sensibility. In South America they may lose themselves in the blood of other people, but in the West Indies and North America they era striving for self-expression and need only such encouragement as just treatment of their fatherland and its spiritual effect on the whole world would give. I trust, therefore, that among the new nations that are to start forth after this war will be a new Africa and a new beginning of culture for the Negro race.

# The First Mass at Grécourt

# The Personnel and Early Work of the Smith College Unit

### By Ruth Gaines

N interesting collegiate, and it is hoped intercollegiate, experiment in social service has been catabolishing a center of rehabilitation for successive groups of villages behind the battle lines in the devastated district of the Somme. The unit has received the recognition of the State Department in the United States and of the French government in France. Through the American Fund for French Wounded, with which it is affiliated, it has been assigned its first twelve villages. These villages are adjacent to those which have already been, for two months, in the care of the fund under Mrs. Dike and Anne Morgan.

The personnel of the unit is as diverse as are the sorts of service it will be called upon to perform. Its director, Harriet Boyd Hawes, is an archeologist of note. She is also a Red Cross nurse, who has nursed in the Graeco-Turkish, the Spanish and the present war. For each of these periods of service, she received recognition from the respective governents of Greece, the United States and France. It was Mrs. Hawes who first had the idea of a Smith College Relief Unit, composed of and financed by, the alumna of Smith. This was in April, 1917. Three months later, the Smith College Club of New York gave a farewell luncheon to the unit, then equipped and ready to sail.

Dr. Alice Weld Tallant, the assistant director, is a professor in the Women's Medical College of Pennsylvania, where she is in charge of the obstetrical department which includes a large dispensary out-practice in the foreign quarter of Philadelphia. She has also been active in directing the social service work of this dispensary. For many years she has been physician to Sleighton Farms, a reform school for girls near Philadelphia. Her experience will be of great value in the devastated areas where only women and children and the old and feeble now remain. Dr. Tallant brings with her as her assistant Dr. Maude Kelly, an Englishwoman who was educated in France and speaks the language almost better than she does her native tongue.

As a part of the unit's equipment consists of three motor trucks, chanflerun were necessary. There are six of these, who combine with their knowledge of mechanics, training in social service, kindergartening, domestic economy and other professions. As a group, they are also young and attractive, assets which the unit has already found of much persuasive value in making progress along the roads of France. The crafts most essential in practical reconstruction work are represented by Alice Leavens, 1903, and Elizabeth Dana, 1905. Miss Leavens is a carpenter, and Miss Dana a cobbler. We also have a farmer among our graduates, who will join us later.

Naturally the peasants of our district will understand their own specialties better than we can hope to do. The farmers,

Written in France, September 13; received in New York October 30.

albeit they like ourselves are women, will take care of our herd of cows, our poultry and our rabbits through the winter, not to mention the fields of wheat we hope to have growing soon. In these matters, they will teach us. But we must buy soon at take with us the materials at least for building shelters and for starting again the small industries of the countryside. We have, as a beginning in the way of shelter, six portable houses of fair size; and the government has anticipated our arrival by building for us three baraques at our headquarters in Grécourt. We have added to this small lumber, cement, glass and roofing for immediate needs. A blacksmith and a painter have already returned to their ruined homes, and we shall take up with us two other refugees, a mason and a carpenter.

The six remaining members of the unit are trained social service workers: Elizabeth Bliss and Ruth Gaines, of New York; Anne Chapin, of Boston; Catherine Hooper, of Mentclair, N. J.; Lucy Mather, of Hartford, and Marie Wolfs, of Newark, N. J. Miss Wolfs has the added qualification of having been a Belgian refugee from Liege in the summer of 1914.

Aside from the actual rebuilding of the ruined villages, which except for makeshifts must wait upon the larger plans of the French government and the cooperation of the Red Cross, there is much to be done in the region assigned to us. The evacuation of this district took place only last March, after an occupation by the Germans of two and a half years. The villages thus occupied received various treatment by the conquerors; in some were the unspeakable horrors with which we have become familiar; in others, up to the last, humanity and a fair return for services rendered was accorded. But, suddenly last March, in all the villages, the order was given for the inhabitants to leave at once. There was no time and no means given to save anything. The villagers fled and on their return ten days later found their homes in ruins, their orchards felled, their livestock gone and their furniture and implements either removed or rendered useless. The people are therefore destitute.

Not only destitute, but for three years there have been no schools. The children—the few there are, have run wild. In Grécourt itself is a church, bare of all furnishings, yet strangely left intact. But the curé is a prisoner in Germany. For three years there has been no mass. The first request of the maire of Grécourt-now a village of twenty-odd women and children-was, I think, for sabots; the second was for their church. On the twenty-first of September comes the day of St. Matthew, the village's patron saint. And we have promised them for that day a curé and a mass. Where we shall get them, we do not know. But in the meadows of Grécourt, back of its ruined chateau, grow luxuriant fourleaved clovers which we have picked and taken as a sign of We begin our work in Grécourt today. On St. Matthew's day we and our villagers hope to consecrate it with a mass in the little church.

# On Keeping a Good Man in Office

E elected an overseer of the poor in our town this week. That may not sound particularly exciting to some, but to me it was an event of considerable consequence. I helped elect him.

It came about this way. I got tired of being an independent in politics and not having the right to vote at primaries and so, the last time I registered, I put myself down as a member of the Democratic party. I was not surprised, therefore, a few weeks back, when a neighbor of mine rang me up. "Say," he called, "You're a Democrat, aren't you?"

"Sure," said I. "What can I do for you?"

"You know Joe Morley, don't you?"

Of course, I did. I buy a paper of Joe every morning.

"Well, Joe's going to have some opposition this year for the nomination as overseer of the poor. I'm trying to round things up for him at our end of town. You know Joe is accommodating, he's always on the job, there isn't one of us he hasn't done some little favor for. Would you come down to the caucus tomorrow night and vote for him?"

Aha, I thought to myself, I'm getting to be a prominent citizen—the politicians are after my support. And over the 'phone I promised to go down and vote for Joe. But why, I asked myself, is there any rivalry over that particular office.

The next evening I presented myself at the town hall to do my duty as a loyal Democrat, and as a friend of Joe Morley. As I stepped into the crowded room, a man handed me a slip of paper with his name written on it. "I hope you'll feel like voting for me," he said. "I'm running for receiver of taxes, and didn't have time to have any ballots printed." Another man crowded his way through the throng distributing other slips of paper. His were printed. He was a candidate for justice of the peace. He gave me one, which I put in my pocket. And after him came two other men distributing other ballots. They were running for auditor and constable respectively. I pocketed their offerings. It was good to be in politics!

Then I saw standing together a group of men whom I had seen before. There was the man with the conspicuous red nose who lives somewhere over the hill. I had often seen him wending his uncertain way homeward. He beckoned to me and I went over. "Are you a Democrat, too!" he asked. "That makes seven of us in our end of town. I didn't know we had that many. By gorry, if I had known it, I'd of demanded recognition for our section on this ticket. We're enritled to it.

"Say," he went on lowering his voice, "Who're you goin'

to vote for for overseer of the poor? Now I don't know what you think, but we're goin' to run Nick Tolman. You know him, don't you? He works up to the pop factory, when he's workin'. He's a good fellow, Nick is, and he ought to have the job."

"Don't you think we ought to renominate Joe Morley."

I asked. "He's held the office for several years, and his experience ought to make him a valuable officer."

"It don't take no experience to run that office," he pretested. "Why, all you have to do is to drive somebody over to the poorhouse once in a while. Anybody can do it. Joe hasn't got no license to hold onto the job all his life. Fix ought to give somebody else a chance."

I wandered on, promising to think it over. Before I has taken three steps someone gripped my hand. "By George. I'm glad to see you here," said my friend. I looked at him and dimly recalled having seen him, with the rest of us commuters, running for a train. "Say, this is a fine crowd all right," he confided. "All the boys are here. I guess there ain't going to be much of a contest except on overseer of the poor. I understand there are four candidates. I'm workir for Jim Blake. He's a good fellow, and he's out of a job. I'c like to see him get this. It's a job that pays pretty well, and he'd take care of it all right, i'm.

"Is there a big salary connected with it?" I asked.

"Not so much salary," he explained, "but there's a chance to make money on the side. You see, the overseer has to place some nice little contracts with some of the merchants, and then, every once in a while, he has to take some disabled or bed-ridden person over to the poorhouse. The law allows him \$4 for a helper when he does that, but, Lord, he can get some fellow to go along for \$1.50 as casy as not. I hope you can vote for Jim, seeing as Rie's out of a job now."

"How does he happen to be out of a job?" I inquired.

"Why, Jim was running a saloon and he had his license revoked. Of course, some folks think running a saloon isn't much of a business, but I tell you Jim is a good boy. He's all right."

Well, we nominated Joe Morley after an exciting contes: 1 noticed in our local paper that the Republicans, too, hat quite a bit of trouble nominating an overseer of the poor, just as we did. They had three candidates instead of four, and the one they nominated was considered the only one "strong enough to beat Joe Morley."

But we elected Joe, I'm glad to say. He's always on the job, and he's done little favors, of one sort or another, for every one of us.

N. S. H.

# VOTES FOR MILLIONS OF WOMEN

WOMAN suffrage swept New York state on Tuesday, winning by a majority estimated at from 70,000 to 100,000 on this second submission of the constitutional amendment. Two years ago it lost by 195,000. Both the state as a whole and New York city went "yes." Thus at a stroke somewhere between two and three million women are given the vote not only, as has been the fashion of late in the middle West for president alone, but for every political officer from sheriff to chief executive of the United States.

In New York state there are 3,060,-848 women 21 years of age and over. No one knows how many of them are qualified to vote: a very large number are women of foreign birth who have not been naturalized. But suffrage headquarters and the newspapers estimate the qualified women citizens at two million. The total number of women of 21 years and over in suffrage states was. up to election day, 8,557,308. Subtracting Ohio's 1,496,225-for Ohio has probably lost-and adding New York, the new total is 10,121,931 who may have at least presidential suffrage, if they are citizens. Thirteen states now have full and nineteen presidential suffrage.

The suffrage campaign was rather quiet, in the midst of popular preoccupation with war. But there was relatively little opposition, except some street-car advertising and the unceasing editorial thunder of the New York Times. Every political party endorsed it as did practically every political leader from President Wilson down to the precinct captains, including many Tammany men.

New York women have worked for the ballot since before the Civil war. The first suffrage convention was held at the village of Seneca Falls—a handful of people in a parlor. It was a matter of widespread congratulation, therefore, that the outcome of their sixty-five years of effort was full suffrage, that the vote was so decisive that there need be no heartburnings over a recount and that it was won on a straight educational campaign.

The Ohio vote was on a referendum upholding the partial suffrage—the presidential ballot alone—granted by the last legislature. The count was incomplete at the time of going to press, but the suffragists were apparently defeated. The issue is being taken to the United States Supreme Court, where the suffragists are confident it will be upheld on the ground that the federal constitution specifically gives to the state legislatures—not to the people—the right to decide who shall vote for president of the United States.

The other Ohio referendum, on prohibition, is still in doubt, with some expectation that the state has gone dry.

TAMMANY came back into complete superior with the complete superior New York city, taking the entire city and county governments and giving Judge Hylan the largest majority of any mayoralty candidate in the city's history. His vote was 297,282 against 149,307 for Mayor Mitchel, 142,178 for Morris Hillquit, Socialist, and 53,678 for William M. Bennett, Republican nomination, which he fully expected, the mayor would have lost. It was a straight Tammany victory and thus ends—or will end on December 31—what was probably the best example of the efficient, business-like type of municipal administration of a big city ever given us on this continent.

Various reasons are given. There were the inevitable opposition and jealousy aroused by four years of an energetic administration, such as, for instance, the controversy over the subsidies to private charitable institutions; the opposition to the modified Gary plan for the city schools; and the widespread feeling that Mayor Mitchel, honestly enough "played the game" of large busi-ness interests, such as the Interborough Rapid Transit Company in the subway contracts and the New York Central Railroad in the West Side development. The fusion administration probably failed to make its work and its motives thoroughly understood to the man in the street and suffered accordingly.

War coming in the last year of the administration was a distracting issue for a municipal campaign. The mayor's ardent patriotism led him to give increasing emphasis to national questions, which at first were discussed only by Mr. Hillquit, until during the last week the discussion centered almost exclusively on war issues and specifically as to whether all those who opposed Mayor Mitchel were, as he declared, "Hohenzollerms" and "friends of the Kaiser."

Mr. Hillquit, who has thousands of friends outside his party, ran up a tremendous vote-a sheer gain of 100,000 over the vote for Charles Edward Russell for the same office four years ago. He polled much of the anti-war vote. though it seems clear that some non-Socialist pacifists voted for Hylan as the more practical method of voicing their protest. New York's great mass of voters of German descent undoubtedly voted for Hylan. And, most important of all in numbers, workers for various parties, settlement residents and others who know voters first hand, report that the tens of thousands of Irishmen in New York kept clear of public argument but went smiling to the polls to vote for Hylan; they are men, some reasoning and some acting on impulse, who draw a clear line between being pro-German on the war and anti-English on the Irish issue. By denouncing them as unpatriotic, Mayor Mitchel lost them in a body.

As to the Socialists, the party vote in Mr. Hillquit's 142,178 was over 100,-000. So far as party organizations are concerned this makes it second in numbers in New York city, only the Democratic (Tammany) exceeding it. And it is possible that the full count will show Hillquit second and Mitchel third. Incomplete returns at the time of going to press indicate that the Socialists have elected two judges, seven members of the state assembly and six aldermen.

### THE FOOD CONSERVATION PLEDGES

AST week's offensive against waste L and ignorance, General Hoover reports, consisted in a combined movement along the whole front. Territory covering nearly one-half of the homes of the United States was taken. The success was due entirely to the close cooperation of the allied forces.

To adopt a less bellicose phraseology, the Food Administration, on the strength of returns received from most of the states, considers the pledge drive a complete success. Rivalry between different communities and different states for numbers engendered the same enthusiasm which characterized the Red Cross and the Liberty Loan campaigns. People with the electioneering type of mind, in the main, conducted the enterprise and

won out.

In actual educational value, however, the results of the week vary considerably from place to place in accordance with the different forms in which the verbal appeal was made and with the extent to which home visits were used for giving enlightenment or enlisting desire for further instruction. From one large city it is reported that visits paid were, on the whole, perfunctory, and that the effort was concentrated entirely upon obtaining signatures - whether given with a full understanding of what they imply or not. Threats were resorted to, in one case, at least, to denounce publicly as unpatriotic and pro-German those who refused to sign.

In many cases, inquiry shows, both the request for pledges and compliance with it, was without reference to actual personal service. Housewives signed the cards as they would sign a petition to the governor, without the sense of having to take part themselves in the task of food conservation by small and varied but concrete actions and sacrifices.

For the purpose of making public opinion, the absurd rumor that the administration encouraged canning only in order to establish for the government a reserve of fruit and vegetables to be seized when needed, was given wide publicity as a piece of German propaganda.

As a matter of fact, such hesitation to sign the pledge as was found usually

A Cartoon Drawn a Year Ago by Bradley, the Late Cartoonist of the Chicago Daily News

was due to one of two reasons: either the person concerned was over-cautious, and did not want to bind herself to an undertaking in such general terms as those contained in the pledge card; or the question was asked why such substitution as might be necessary in the interests of all the allies was not made in Eurone.

In partial reply to this question, the food administration issued a statement to the effect that the European nations are already using from 20 to 50 per cent of corn, potato and other adulterants in the manufacture of their bread. and that the British government requires a minimum of 20 per cent in all wheat bread and permits a maximum of 50 per cent. Corn meal cannot be shipped because it would spoil, and comparatively few mills in England and France are equipped to grind the whole corn.

Generally speaking, the campaign demonstrated a remarkable public confidence in the government. There was practically no active opposition, and the majority of the people, according to H. J. Hill, national campaign director, have come to look upon food conservation as a definite war service which they are willing to render if shown how.

### EVIDENCE OF UNREST IN COLORADO

REPORTS of a strike in one of the mines of the Colorado Fuel and Iron Company have recently appeared almost simultaneously with a report from the Industrial Commission of Colorado. giving the company a clean bill of health on all matters affecting their relations with their employes,

A few weeks ago, a delegation of Colorado miners was sent to New York to see John D. Rockefeller, Jr. Mr. Rockefeller was out of the city, and the men saw Starr J. Murphy, a director of the Colorado Fuel and Iron Company, instead. When the delegation returned to Colorado one of them, an emplove at the Sopris camp, was discharged on the ground that he had been absent two weeks without leave. The rules of the company make an absence of over 3 days without leave cause for dismissal. This action led to a stoppage of work. The mine was idle one day. The man was then reinstated and work was resumed. Another report from Colorado states that the superintendent ruled that the delegate was a "new employe" on account of his absence over the three-day limit and would have to take the physical examination required of all new men. The man, it is said, feared that this was merely a ruse to get rid of him.

The report on conditions in the coal camps, just issued by the Colorado Industrial Commission, grew out of the strike threat of last summer. On July I district officers of the United Mine Workers served notice on the commission, in accordance with the Colorado law, that if certain grievances were not adjusted, a strike would be called at the expiration of thirty days. At a conference held later in the month between representatives of the miners, the Colorado Fuel and Iron Company and the Industrial Commission, a list of nineteen grievances was presented, the first one being in the form of a demand for recognition of the union. This demand, President Welborn of the Colorado Fuel and Iron Company refused to consider. The conference took up a few of the other grievances, but adjourned sine die leaving most of them unsettled.

On July 28, two days before the strike was to have begun, if called in accordance with the original notification the Industrial Commission "took jurisdiction." That is, it announced that it would investigate the situation. This made it illegal to call the strike at the time set.

The report, which has just been issued. indicates that the commission has visited every mining camp of the company. Each one of the grievances was considered, and most of them dismissed as without justification, or as of small conse-

IN CAMP WITH THE Y. M. C. A.

Above, a boxing match in front of the outdoor movie screen, with a typical camp building at the left. Below, a tent used until a building can be erected and one of a great fleet of motors which reach all earny. The 1' M. C. A. is starting this week a campaign to raise \$33,000,000 for its war work here and in Europe.

quence. One of the complaints was the setting of an age limit of forty-five years tor new men. The comment in the report is, "as it is the company's right to employ whom it pleases, this question s not considered a reasonable cause for complaint."

The report states that there has been so the United Mine Workers, and it ascribes the demand for recognition and the threatened strike to "perty internal solitics." The commission expresses the belief that "there is no excuse for making a demand for recognition during times like the present, when the country a at war and needs the undivided support of all its people."

In the final summing up all of the grievances are dismissed as without sufficient foundation, excepting one affecting wages in the Canon district. The commission finds that the rate should be advanced in this district six cents a ton.

The compulsory investigation law in Colorado and the personnel of the present commission are both viewed by or-

ganized labor with extreme disfavor. It is not likely that the report just made, which does not appear to be wholly impartial in spirit, will tend to pave the way toward greater cordiality of feeling.

### THE CLASHING BRANCHES OF THE I. W. W.

THE Weekly People of New York, spokesman for the Socialist Labor Party, states in its issue of November 3 that there were three errors in the article by John A. Fitch in the Suwer for October 13, entitled Sabotage and Dislovalty.

The People states that the I. W. W. was actually organized in 1905, instead of 1904; that Haywood was not "eliminated from the Socialist Party in 1913," but that he was removed from membership in the National Committee in that year and remained for some time afterward a member of the party, and that it is incorrect to state that "since the organization of the I. W. W." the practice of sabotase has been one of its doctrines.

The first two corrections are of small

importance, for the call of the first I. W. W. convention, as the People points out, was issued in 1904; the elimination of Haywood from the National Committee in 1913 amounted practically to his removal from the party.

The statement about sabotage, however, was a serious error which ought not to pass uncorrected. To quote from the Weekly People:

It was only in 1907 that a group of anarchistically minded members began to advocate "striking at the ballot-box with an ax" and to glorify abotage. At the following convention in 1908, the preaching of these doctrines caused a split in the organization, and the split of the sp

This is quite true, and the statement as it appears in the SURVEY article of October 13 does an unintentional injustice to that branch of the I. W. W. which has its headquarters in Detroit, and which has always been opposed to the Chicago group, the outstanding leader of which is William D. Haywood.

### AN AMERICAN CITIZEN FROM JERUSALEM

SAMUEL Jacob Davidson left the Junied States twenty-three years ago when he was four years old. His grandfather, like many pious Jews, desired to spend his declining years in Jerusalem, and his father, who had been a tallor in New York, laid aside his own economic advancement and went with him. Hence Samuel is a good American citizen, along with several hundreds of others and their children in the holy city.

He belonged to a party of eightythree such Jewish Americans which the other day arrived here from Jerusalem after a journey through Turkey, Serbia, Bulgaria, Hungary, Austria, Switzerland and France, which took them four months. Five hundred and seventy Americans had to be left behind; but the Joint Distribution Committee of Jewish relief agencies, with the aid of the State Department, is arranging for other parties.

Conditions in Jerusalem, as described by Davidson, are deplorable. He himself, though his father was poor, had received a scholarly education and, until his departure, was assistant principal of the Talmud Torah, "Tree of Life." From an average of 850, the population of this school during the war land shrunk to 550. By far the greater number of the 300 missing are dead of starvation. A few were among those foreign-born who, with their parents, escaped to Egypt last year.

At ordinary times, many of the Jerusalem Jews, especially the aged, live on remittances from their relatives and other contributions. These for the most part are cut off now. Owing to fear of

the armed force which is so apt to follow the foreign investor, Turkey in the past has not allowed the establishment of large industrial enterprises in Palestine financed from the outside. The result is that the majority of the ablebodied Iews are either dealers or engaged in such occupations as bakers, tailors, shoemakers, butchers, and the likein both cases living largely by "taking in each other's washing.

Frequent rumors to the contrary, there is not the slightest interference with funds sent to Palestine from this country by the Ottoman government or graft to officials. The fact that payment is made in paper-no gold being available for circulation-makes no difference to an honest exchange, so far as the banks are concerned. But in practice, the difference in value between gold and paper money is much greater in retail trade than in large financial transactions, because of the popular greed for gold. Hence, when a Turkish pound was quoted as worth \$4.25 in gold and \$3.20 in paper, in reality the golden pound purchased forty-five pounds of flour and the paper pound only ten and one-half pounds.

This, however, is only one cause of high prices and starvation. The other is speculative hoarding. As soon as government officials attempt to set a maximum price, the warehouses are closed and the people are informed there is no flour. This boycott is maintained until the authorities drop their intended regulation. Most of the successful speculators are Arabians, a few are Jews.

These various reasons, according to Davidson, explain why the \$20,000 a month which reach Jerusalem from this country-\$40,000 for the whole of Palestine-is not nearly enough under present conditions. The price of flour has practically doubled in two years, and everything else proportionately, and sources of self-help are largely closed. He considers that at least \$60,000 a month should go to Jerusalem alone, to keep its Jewish inhabitants alive.

Another point upon which he insists is that food is not the only urgent need of those left behind. They hunger for spiritual aid and look to America to keep their schools going, some of them built up with the devotion and sacrifices of generations.

The party when it arrived in New York was much impressed with the carefree, happy, well fed look of the people in the streets; but after their long journey during which they did not everywhere meet with unmixed friendliness, they were even more impressed by the cordiality of America's welcome to them and the uniform kindness and helpfulness of gentiles as well as Jews.

Incidentally, Davidson's case illustrates modern immigrant distribution methods at their best. It has already been said that he is a scholar. He speaks Arabian, Hebrew, French and English as well as Yiddish. Under the old methods, no account would have been taken of his attainments; he would have been sent as fast as possible into some sweated, unskilled employment to make him self-supporting; he would have come back time and again for more relief, and his family would have been helped in every emergency.

Instead, the Hebrew Sheltering and Immigrant Aid Society has made a home for Davidson and his family until he can be properly placed. He has been found work as teacher at a Hebrew school at a salary of fifteen dollars a week which will be raised to twenty dollars as soon as he proves himself. He immediately arranged to attend high school to perfect his English and to learn something of business methods so that he may be able at some later time to change his career.

From a photograph taken while the party was in Switzerland on its long trip to the United States. Mr. Davidson is the bearded man with plasses and a derby hat in the center of the back row

# Book Reviews

AN INTRODUCTION TO EDUCATIONAL SOCIOLOGY By Walter Robinson Smith. Houghton, Mifflin Company. 412 pp. Price, \$1.75; by mail of the SURVEY \$1.87.

There is a peculiar zest for social workers in reading this book. They may be par-doned for feeling somewhat as one would who had discovered a new continent which later the whole world found also. For three decades social workers have been dinging it into the ears of edu-

cators that the school is a social institution, that a sound mind in a sound body is not an adequate ideal of education, and that achievement is more than a matter of indi-vidual ability alone. They have insisted that Herculean muscles and Platonic intellect must be harnessed to a social consciousness if everybody is to have his chance at both work and play in the world. And by social consciousness they have not meant, of course, mere altruism. They have meant efficiency and larger vision, the joy and the results that come from working with others, not against them.

Social workers have made some progress ith these ideas. The mass of teachers, with these ideas. The mass of teachers, however, is probably still impervious to them. It is only three years since Edward T. Devine gazed at the retreating backs of an audience of school superintendents when an addresse of sensor superintendents when the tried to bring home to them a sense of responsibility for the social ills of pov-erty, disease and crime. His words meant little; they had not heard of "educational

Professor Smith was one of the first to try to formulate this new science, if science it can be called. His course in educational sociology at the Kansas State Normal School at Emporia followed Professor Suzzalo's at Teachers' College by a year. Professor Smith defines educational sociology simply enough as "the application of the scientific spirit, methods and principles of sociology to the study of education." By such study, he says, the social laws governing education be obtained and applied in ways that will improve educational practice. He then discusses social organization, the individual and the social group, primary social groups such as the family and the community, intermediate social groups such as the church, the state and education, the evolution of the modern school, etc. These he tries to look at from the standpoint of their educational

Heretofore psychology has been the chief handmaid of education. Educators have slowly been forced to acknowledge their dependence upon the Individual's attention, his power of association and memory, his will to know. Now Professor Smith discusses their dependence upon the changing character of the family, upon labor unions, farmers' institutes, women's clubs, literary societies, philanthropic foundations and the like. He substitutes the mass for the single mind. He is interested not in the sound made by a single instrument in the orchestra, but in the

The educational applications of these laws include such comparatively modern devices as the school survey, the organization and professionalization of teachers, vocational guidance and training, the socialization of the curriculum, student self-government, the use of group stimulus in the classroom, etc. Professor Smith discusses these and many other topics. He devotes fourteen lines to 'articulation of the schools with other institutions" and does not discuss school extension activities. Yet 463 cities reported over 59,000 group occasions in public school buildings after aix o'clock in the evening last year, and none of these were classes.

The book is significant as an early contribution to social education from the standpoint of society rather than that of education. It is written in text-book style, for college students, and is easy to understand. rofessor Cubberley says in his introduction, it deals not only with theory, but affords "a social interpretation of our modern educational progress.

WINTHBOP D. LANE,

THE MODEAN HIGH SCHOOL-ITS ADMENTS-

TRATION AND EXTENSION By Charles Hughes Johnston. Charles Scribner's Sons. 848 pp. Price \$1.75; by mail of the SURVEY \$1.91.

PROBLEMS OF SECONDARY EDUCATION

By David Snedden. Houghton Mifflin Company, 333 pp. Price \$1.50; by mail of the SURVEY \$1.62.

ECONOMY IN SECONDARY EDUCATION By William F. Russell. Houghton Miffiin

Company. 74 pp. the Survey \$.79. Price \$.74; by mail of

American or Americanized parents usually girls to the public high schools, fittingly called "the people's antiversities," rather than to commercial or technical schools. They do this in spite of the reputation we have among foreigners for commercial

The reason, in part at least, is afforded by the adherence of teacher-training schools to traditional aims and methods. "Keeping up with Lizzie" is as much a part of educational philosophy as of social climbing and parents are generally sure of one thing; their children must have just as "good," as genteel, an education as any other children in the community

These three books throw some light on how to win for the modern high school more friends among two extremely important classes—parents and their growing boys and girls. We all know how frequently adolesgirls. We all know now frequently assorted cent boys and girls get the work fever or a wandering spell or a general dis-gust for all academic studies during the high school period. This is the other side to the school period. This is the other side to the devotion of their parents. For one group the schools must be made to repay devotion, from the other they must be made to secure de-

Dr. Johnston has edited with unusual skill a most readable hand-book of information on The Modern High School. In this voltime of \$50 pages is told, by leading experts in education, the story of the administration and extension of the modern high school as these relate to the public demand for the training of adolescent boys and girls in a thriving, pulsating, developing democracy.

The volume is, as the editor in his preface states, "a survey of policies, examples and suggestions of ways and means of making the strictly socializing work of our actual high schools more definite, more effective and more nearly universal." Its chief limitation is its adherence to the use of what may be called an "educational jargon." How much called an "educational jargon." How much meaning is conveyed to the average reader even of this book by such words as "func-tion," "organism," "co-ordination," "evalu-ate," and "adaptation?"

Dr. Snedden has prepared a three hun-dred-page volume of helpful letters on problems in secondary education, which will be read with interest by layman and schoolman slike because of its refreshing style and hopeful outlook on education in a democ-racy. The letters are addressed to all the active agents in secondary schools, the superinendent, university president, principal, teacher, and member of important educational committees. The author has put into the book the philosophy of education that he has been expounding as a teacher and trying to practice as a state commissioner. There is on in all that Dr. Snedden sends forth. The constructive programs which this practical teacher has outlined as dreams will become commonplaces before many years.

Dr. Russell strikes squarely at a serious problem in American education. "Economy in education," he says, "means the transfer to the pupil, in the fewest years and in the most thorough manner, of a certain relatively complete fund of knowledge and a group of habits and methods of work which are likely to prove useful in the life he is to

"The application," he adds, "of the in-vestigations of psychological and physio-logical fatigue will result in spreading out the work more evenly, with short and frequent periods of rest, rather than in grouping the hard work in a few days." This, of course, means that better teaching methods must be introduced; better organization must be provided; the time of the brightest pupils must be saved

These three books approach the problem These three books approach the problem of secondary education from the modern point of view and tell what the public can do to make the high school a vital power in making citizens in a democracy. They indicate also what is being done, and what still remains to be done, to make the school a remains to be done, to make the school a contract of the work of the contract of the contr WILLIAM ANTHONY ARRY. youth.

THE CHALLENGE OF ST. LOUIS

By George B. Mangold. New York Missionary Education Movement. 271 pp. Price \$.60 (cloth), \$.40 (paper); by mail of the Sunvay \$.70 and \$.45. That the Christian church must translate

into what Professor Taylor ealls "social action" the Sunday preachments, is being felt more and more. First the unchurched insisted upon it. Now those interested in the church are recognizing it. An additional evidence of this is a series of books announced by the Missionary Education Movement of the United States and Canada. first of these books, The Challenge of St. Louis, was written by George B. Mangold, director of the Missouri School of Social Economy, who, with the eyes of a sociologist, goes through this metropolis of the Southwest and points out in what way the city is a challenge to the church.

Starting out with a religious survey, Dr. Mangold finds there are some 400 Christian churches, valued at some \$15,000,000. He then wants to know what these churches do in connection with the 21,000 illiterates of the city; with that half of the children who do not finish the eighth grade; with the 10,000 children at work. He knows that more than 6 per cent of all persons who die in St. Louis are buried in pauper graves; that one out of twenty persons is arrested annually; that about 10 per cent of the population needs relief of some sort; that there are more than 200,000 persons who never attend church; that there is a saloon for every 100 men; that the social evil is a constant menace; that the cost of living is threatening to sink thousands of scif-supporting families below the poverty line.

Dr. Mangold wants to know what the churches are doing to help remedy these and many other evils. He insists all through the book that the church has a duty to perform and that it cannot remain satisfied with mere lip service. The book is really a social survey of the city, which should prove both useful and interesting to many more than the laymen, or perhaps laywomen, for whom it was written. It is understood the organizations during the coming months in the hope that good may come of it. Those who study it will not only learn that "something must be done," but why it must be done and what can and should be done. Dr. Mangold has performed a good service, both as a sociologist and as a Christian.

OSCAR LEONARD.

NEWSBOY SERVICE By Anna Y. Reed. World Book Company. 175 pp. Price \$90; by mail of the Survey \$.98.

Most of us who have learned that street work is not good for small boys and believe that it is apt to create irregu-larities in school attendance, will be as-tonished at Anna Y. Reed's discovery in her study of 1,357 Seattle newsboys that the newsie is actually a more regular school

attendant than the average boy. Of the total male school population of Seattle, 10 per cent have perfect attendance records while of the newsboys 35 per cent have per-fect records. Why, then, is it that in Seattle as elsewhere there is such a high percentage of retardation among newsboys? Mrs. Reed suggests that it may be because of too long hours of work outside school, or unseason-able hours, or bad home conditions. But here, as throughout her study, she is reluctant to draw conclusions because of the insufficiency of the data, yet at the same time appearing to doubt the validity of other people's conclusions in other cities.

Her book is valuable as a minute study which attempts to be "fair to the newsboy." It is weak insofar as it draws general conclusions from conditions in a single city which one suspects are in some respects unusual. Seattle newsboys are apparently of a higher grade educationally than other newsboys. The comparison of retardation figures in New York, Toledo, Kansas City and Seattle, puts Seattle at the top of the list with only 32 per cent retarded, and Kan-sas City at the bottom with 75 per cent. The Seattle newsboys appear to have a much closer connection with the newspapers than most newsboys. There are only three daily papers in Seattle and, according to Mrs. Reed, the circulation managers direct the work of the actual sellers of the papers much more than is possible in a larger city. "The circulation manager knows which in-

fluences act and react favorably on newsboy efficiency—he 'picks carefully from good homes and fires the failures'," says Mrs. Reed. This is not true in a city where the circulation department of a single paper never sees one-quarter of the newsboys them-

selves. These are but isolated instances of the facts which make us believe it unsafe to consider the condition of Seattle newsboys typical of the whole newsboy world. Indeed the great defect of Mrs. Reed's book is that its title, Newsbuy Service, leads one to a false impression of its universality. But it does undoubtedly disclose some interesting facts as to the Seattle newsboy, facts which have their bearing on the whole street-trad-ing question. Mrs. Reed states emphatically, for instance, that wholesalers do not want boys under twelve in their employ, and would prefer to have them off the streets. (Seattle has no regulation of street work, and 35 per cess of the boys selling on the streets are under 12.) She states, furthermore, that boys of fourteen or under should not be allowed to work after 7 P. M. or before 5 A. M. These things are in direct line with all the agitation for street trades regulation throughout the country, and the inference in that Seattle and the state of Washington need a street-trades law.

But the emphasis in Newsboy Service is n the vocational aspects of the subject, and Mrs. Reed's recommendations for the study of the vocational value of newsboy service by the schools suggests rather that newsboy by the schools suggests runer that newsony service should be prepetuated as a vocational adjunct to school training than that it should be regulated, and abolished so far as the younger boys are concerned. She refuses to believe that newspaper selling is a blind alley occupation, because she feels that no occupation is a blind alley for the boy who renders faithful service and looks ahead. There is always a future," she says, "provided there be ability to see it and perse-verance to pursue it." Yet she admits that most of the newsboys are twelve or under, and it seems to be asking a good deal to expect a boy of twelve to look far into the

The moral and physical dangers of street work and the economic fallacy of it this study seems to minimize although admitting them. The point of view of the book is summed up in the sentences, "More detailed information regarding newsboy pupils and full information regarding all school pupils is necessary before it is safe to draw definite conclusions regarding the connection between any given influence and newsboy service." And with this statement everyone who has studied the newsboy will, in a measure, agree. Certainly we know very little about the newsboy. Baltimore knows a little about her newsies; New York knows a little about hers; and Seattle knows a little about hers. But as to the general condition of the newsormation. If other cities and other vocation bureaus would make such a study as Mrs. Reed's, possibly we might find out in due time what sort of a boy the newsboy

really is and what we can do for him. LIABILITY AND COMPENSATION INSURANCE

HELEN DWICHT

By Ralph H. Blanchard. D. Appleton and Company. 394 pp. Price \$2; by mail of the SURVEY \$2.15.

Within the last few years the development of compensation has been so substantial that is has become a subject of regular university teaching. Mr. Blanchard's book follows the outline of a course of instruction given by the author at the University of Pennsylvania. and it has both the advantages and disadvantages of most text-books. The author has to be commended for the clearness and conciseness of statement and helpful bibliographic noies. On the other hand it must, like most text-books, be dogmatic, and one fails to get the impression from reading the book how much is still controversial in the

field of compensation. The title indicates that special attention is paid to the somewhat technical insurance features rather than the social aspects of the compensation movement, and the book is probably better adjusted to the needs of colleges of commerce. However, by actual count the 290 pages of the author's text are about equally divided between the discussion of industrial accidents and their compensation, and a study of the insurance methods. Even the non-technical student making available the many studies appearing in the proceedings of the Casualty Actuarial and Statistical Society, where all the com-pensation insurance problems are being dis-cussed by experts and which have been freely quoted in the book. Considering that all the social as well as business features of compensation are matters of controversy, one might expect more of a critical attitude toward methods of rate-making, merit-rat-

ing and reserves than is found in the volume. One is somewhat inclined to question the wisdom of the printing of the New York compensation law as an appendix to the book. The New York act is not as typical as a good many other acts. Moreover, the sext of the act, with the official notes of the New York State Industrial Commission, can be obtained from that commission for the anking. It has swelled the book by seventy-five pages and probably also the price. And finally, the text of the law being brought up to January 1, 1917, was out of date at the time it was published. Perhaps the publishers are more to be blamed for this unnecessary padding than the author.

I. M. Rustnow.

CITY PLANNING PROGRESS IN THE UNITED STATES

Compiled by the Committee on Town Planning of the American Institute of Architects, edited by George B. Ford and Ralph F. Warner. 207 pp. Price \$2 (cloth), \$1.50 (paper); by mail of the Survey \$2.15 or \$1.65.

The introduction to this volume, entitled Getting Started on City Planning, is reminiscent of Stephen Leacock's famous description of a whirl-wind campaign. "First of all a few of the business men got together quietly-very quietly, indeed, the more quietly the bet-ter-and talked things

over." And so on, people go on "quietly dining and lunching together, drawing in first the one, then the other of the interests concerned-nntil one day things happen. If sometimes things do not happen, at least there are recollections of pleasant times spent together and of a decided help to good neighborly feeling.

Anyhow, in the scores of cities dealt with

in this volume, the luncheons, dinners, committee meetings and delegations have, on the mittee meetings and delegations nave, on the whole, been wonderfully successful. Nearly one-half of the cities with a population of 100,000 have, during the last year, sub-stannially advanced the cause of city planning in one way or another. In the smaller cities and towns also the progress, considering the youth of the movement, has been remarkable.

In forty-three cities, comprehensive cit plans have been inaugurated or prepared in 1916. In New York city, the drastic building zone law, limiting height, area, and use of every huilding in this great metropolitan district, has, since it was put into force, been thoroughly applied with the cooperation of property owners. This is described as the leading accomplishment of the year. California, by her law permitting the ap-pointment of city planning commissions, has

joined the four other states-Massachusetts, New Jersey, New York and Ohio-which previously have given legislative sanction to this important function of city government. In Indiana-where a similar bill last year was defeated, in Michigan, North Carolina, Texas and Utah, campaigns for state recognition of city planning are under way. Pennsylvania has passed a permissive zoning commissions in cittes of the first class, and Massachusetts has passed a new act providing for the appointment of boards of

survey to control planning.

Interurban and state conferences, some of them very influentially attended, have created enthusiasm where the subject was hardly appreciated before. Instruction in city plan-ning has been introduced in a number of universities and colleges, nine of which now give full courses of lectures in this field. The complicated problems involved in the planning of adjoining towns under separate administration have been studied in many places: and in a number of states there are now movements on foot for the creation of joint policies in planning for the extension and future traffic development of even larger Indeed, the beginnings of a national units. plan of highways may be discerned in the formation of the Joint Board of Nation Planning created by the enthusiasm, chiefly, of Cyrus Kehr, of Knoxville, Tenn.

The volume under review is alphabetically arranged, well illustrated and, while nat-urally too sketchy for a detailed study of the steps taken in all the different cities and towns, full of suggestion for those who contemplate action in their own community. It should lie on the library table of every chamber of commerce and city elub.

BRUNG LASKER.

THE FOOD OF WORKING WOMEN IN BOSTON By Lucile Faves. Women's Educational and Industrial Union (Boston), 213 pp.

Price \$1; by mail of the Survey, \$1.10. This study pives interesting side-lights on the food problem of the working woman. There are exhaustive discussions on the cost of food in Boston, the noon luncheon problem, the food of women living alone, the food of women in organized bouses and the food of dispensary patients. The book makes a strong plea for constructive work in dietetics, and urges further efforts to promote the better nourishment of women under twenty-one years of age. When we realize that 80 per cent of the women in factories never have a hot noon lunch, that only 20 per cent of the women in shops were able to take advantage of the lunch room and that 40 per cent of those in offices eat end lunches we are glad to have this con-firmation of our own convictions on the

tive lines. Everyone who has seen the effect of undernourishment on the lives of our hard-working folk will be ready to subscribe to the author's suggestion that those who are inter-ested in social problems unite for conference and definite plans along the following lines:

necessity for further work along construc-

1. The best methods for spreading knowledge of the underlying laws of nutrition and food preparation.

2. Education of working women their own needs and their own possibilities.

The author points out that while the investigations produced no direct evidence

that the health of working women in Boston suffers seriously from insufficient food, a study so comprehensive can not be expected to furnish evidence of such character as to settle this point. As Dr. Eaves says, it was not practical to judge the health of the women according to freedom from morbidity. The questions raised by the study, however, are so vital, and the steps taken toward solution of the problem so definite and helpful that we find the book of distinct value to all interested in this subject.

AN HISTORICAL INTRODUCTION TO SOCIAL

ECONOMY By Dr. F. Stuart Chapin. The Century Company, 316 pp. Price \$2; by mail of the SURVEY \$2.15.

This is a most comprehensive and useful

WINIFRED STUART GIBBS.

little text-book that reviews the history of social economy from ancient Greece to the present war and has illustrations of the Akropolis, Zeppelins, the Colosseum, the stornach digesting food, and the building of Ford autos. It is rather a wide subject for 300 pages, and it is necessarily a little for 300 pages, and it is necessality a little sketchy. A single page is devoted to the feudal manor. However, most of the more essential facts are well boiled down from Cunningham, Ashley, Cheney, Gibbins and other well-known secondary authorities; the work is markedly free from bias of any kind. The proportions are fairly maintained, but the writer seems chiefly interested in the Gracchi, moving pictures and English industrial insurance. As a general introduction to a great subject the book is sound and valuable.

IAN C. HANNAH.

### SAID OF THE SURVEY

To THE EDITOR: I thank you most cordially for the copy of the current issue of the Suavey [Our Daily Bread, October 20] which you sent to me. It is most interesting and most instructive and all of us here feel it will be very helpful not only to the campaign in New York city but throughout the country.

I read Mr. Lasker's article with a great deal of interest and doubt very much if the whole spirit of the conservation move-ment has been put forth in simpler or more convincing language than we find it here.

AUGUSTIN McNally,

[Manager Publicity Department, U. S. Food Administration.]

New York.

so frequently,

To THE EDITOR: I want to express my appreciation of the excellent articles on public health which appear in the SURVEY

I have recently attended several conventions dealing with various aspects of the public health problem expecting to learn many new things about child hygiene work. many new things about child nyglene work. While the conferences were most interesting and it was more than worth while to hear and see some of the prominent people in the country, I really gained very little that was new. In many instances I had gained from the SUNEY a much more accurate and definite idea of work being done in Canada, the United States and other parts of the world than I gained from the speeches at the convention. In all meetings the war note was strongly emphasized and the health problems arising from the war, and as I stated above, in each case

I had already a pretty definite ides of The Survey seems to me a very valuable paper for all medical social workers, and I hope the public health articles will con-

what these activities were,

BERTHA F. JOHNSON, M. D. IChief, Division of Child Hygiene and Nursing, State Department of Health.] Trenton, N. J.

# "ADMIRABLE" LABOR CONDI-TIONS

To THE EDITOR: In a contemporary of yours, great success is promised for an In-dian corporation because of the admirable labor conditions. In reading the article more closely, the American representative of this corporation stated "that native female labor employed quite exclusively in the Far East, is procurable from at least 4 to 6 cents per day. Unskilled male labor is ap-proximately 10 to 12 cents a day, while skilled labor is available at 15 cents a day. What is required is great patience in dealing with the native laborer."

This is a case where labor conditions are admirable from the point of view of the employer. In this country, let us hope that when the phrase is used, it will take into consideration not only the employer but the employe. I. D. H. New York.

### FOR DEAFENED SOLDIERS

To THE EDITOR: In your issue of September 8 you mention the New York League for Hard of Hearing and I write to ask if you will make mention at your convenience that Los Angeles, Cal., has a League for Hard of Hearing, a branch of the New York league.

York league. We are working to build up a strong so-ciety for belpfulness of all kinds to the deaf, and shall be more than glad to assist any deaf soldiers or their families sent back to Loa Angeles or its suburba, through scholarships, in lip-reading courses, looking out for work, trying to sell any handicrafts they may produce. We have given our enthey may produce. We have given our en-tertainment for the Red Cross and the money received, though a small sum, was used to furnish yarn to inmates of the Los Angeles County Hospital, who could not afford to buy varn but were eager to help. The deaf are cut off from many forms of

employment, and it will be the main effort our league to bring together the deaf and the sort of positions they can fill. Also we lay much stress on the social side. AUCUSTA SENTER.

Pasadena, Cal.

THE I. W. W.

To THE EDITOR: One of the sweetest sanest women I know, a great poet, a gentle and eloquent idealist, and a fourth person whom I do not know, are on trial in New York today on fifteen thousand charges. The charges are wild, incredible, absurd. does not matter, however, since the real crime of which Elizabeth Gurley Flynn, Arturo Giovannitti, Carlo Tresca, and Baldazzi are accused is that they are workers for the I. W. W.

I have just this minute finished reading a letter in your issue of October 20 by an M. A. Matthews, who purports to be a minister in a church which is supposed to represent and do the work of One who was represent and do the work of One who was crucified because "He stirreth up the peo-ple." One who taught "thou shalt not kill" and that the wealthy should "give all thou hast to the poor and follow me." Yet this letter in terms that are rather Herod's than the Carpenter's preaches: submission to authority, right or wrong, hatred and slaugh-ter of one's enemies, loyalty not to "the kingdom of Heaven," but to America's present administration; and winds up with the power of Almighty God . . . damnable enemies like the I. W. W. at home and abroad shall be forever chained."

The letter also quotes from the principles and platform of these "damned" I. W. W. And lo!—how sadly must the Crucified smile, if the letter of M. A. Matthews, Reverend, His earthly representative, ever reaches Him!—for the principles of these "enemies" are His, and the platform is designed to fulfill them.

E. RALPH CHEYNEY.

New York.

To THE EDITOR: Enemies of I. W. W. are unwilling to accept parodies such as that on Onward Christian Soldiers as "bits

of satirical verse." I do not know how bravely the I. W. W. is talking at present, but this summer I had the pleasure of working beside members o this organization and at that time all of them with whom I came in contact, and there were many, stated frankly that it is there were many, stated frankly that it is their intention to take the land from the "damned farmer," to put all industries, the railroads, akilled labor and the government out of business and to institute a government "by the roughnecks and for the roughnecks and to hell with everyone else."

They attacked not only the employer but also skilled labor, efficiency, all social

our also skilled labor, emcleacy, all social organization, everything in the nature of religions, belief and authority. Pamphlete circulated by them vilely in-sulted women in the little town of Elk River, Idaho, because they, with the preacher, storekeepers and clerks, offered to do what they could around the saw-mill and planer. I can not quote word for word but the pamphlets suggested in the plainest, most unvarnished and unmistakable terms that the women with the help of the preacher, might breed a race of scabs to help them in the work for which they had volunteered.

It is surely the duty of all clean, righ minded men and women to stamp out this seditious, rotten organization and to see to it that steps are immediately taken to counteract those influences, whatever they are, which have made possible its inception and growth.

C. L. AINSWORTH.

Chippewa Falls, Wis.

### MAINE GOING DRY

To THE EDITOR: In an article written for the SURVEY for January 27, page 482, entitled, What Grandfather Thought About Drink, I showed that Maine went dry in an Drink, I showed that Maine went dry in an old prohibition era (1851) before the Civil War. The war sapped the whole movement, diverting all the energy to the slavery question. After the war we were morally relaxed, crime statistics rose, total abstinence gave place to the ideal of moderate drinking, and Maine introduced the Petersen plan. Cities that wished could have saloons pro-vided those saloons paid a fine, practically a license.

Later when the country began to get up

steam for reforms again and prohibition raised its head in good earnest, Maine with its lax enforcement in cities, undoubtedly held back the movement, especially in the

E aut But I am glad to be able to write that even the cities of Maine are coming into line. I spent the morning of August 21 in Bangor. On January 1, saloons running openly were closed with the following result:

ARRESTS FOR DRUNKENNESS Jan.-July, 1916 (Open Saloons) Jan.-July, 1917 (Closed Saloons) Jan. 165
Feb. 159
Mar. 335
Apr. 239
May Jan. ..... 54
Feb. .... 77
Mar ..... 123 239 239 257 279 Apr. 86
May 103
June 137
July 192 Total ..........1,772 Total ..... 772

No change had been made in the method of arrests, men being arrested only when absolutely necessary. I found the secretary of the Associated Charities discouraged because arrests were mounting in June and July. But drunkenness is usually greatest

in the thirsty summer months.

In short, that difficult river city into which armine of lumber men are injected weekly, has made a fine beginning. But of course there is any amount of illegal selling yet-places running behind screens and pocket-peddling. I was taken personally to places behind screens; the bartenders, if such they were, would look sorely troubled at our arrival and explain that they sold only nonin the thirsty summer months. alcoholic beer.

The queer thing is that while so many places were closed out on January 1, the few were and are allowed to remain, for their places certainly are known to many officials.

places certainly are known to many officials. But Maine has made a beginning, got her prohibition legs on again. What is needed is more sentiment among the respect-able people. Said a city official to me: "A few women in Bangor would close up all these leavings, if they would only take hold of the problem." I wish this letter of mine might find the women who would take hold. ELIZABETH TUTOM.

Cambridge, Mass.

### THE CHOICE To THE EDITOR: One of your subscriber

in the issue of September 15 under the head-ing "What are we fighting for?" very proper-ly deplores the fact that he does not know. His honest doubt in this era of stress is a not infrequent mark of idealistic minds. When infrequent mark of ideallstic minds. When the time calls for prompt, strensous and united national action "their native hue of resolution is sicklide ofer with the pale cast of thought." At this time two questions are being confused, the first, why did we get into this war; the other, on exactly what terms shall use end it when victorious? It would be pleasing to have all worked out in advance to the minutest detail the terms of an ideal treaty of peace; but we shall have little or no part in fixing those terms unless Germany is soundly defeated; and Germany can not be defeated if the nations opposed to her organize themselves into debating societies instead of into united and efficient military organizations. If we wish to make our country weak for action, as Russia has become of late, if we wish to labor for the triumph of pan-Germanic imperialism, we can do nothing more fitting than to become the disciples of vacillation

by following the advice and example given Any brief statement of the reasons why and the principles for which our country is at war with Germany will appear insuffi-cient to the writer of that letter and to others in his frame of mind, unless they fill

in the letter in question.

the words with a meaning derived from the political and philosophic developments of the past quarter century. However, I would suggest as helpful to them, bulletin 34 of the American Rights League, entitled A New Declaration of Independence. Or if that appears to be too "rhetorical," let them read Vernon Kellogg's articles in the Atlantic for August and October, showing how paci-fist convictions are rudely shattered by close contact with the pan-Germanic dogma.

In any case we are at war with Germany. What shall an American, whether of "New England English" or of other stock, do right now-discuss might-have-beens and mightbes that give aid and comfort to the enemy, or help to win a victory for America and the allies?

FRANK A. PETTER.

Princeton, N. J.

### FROM A "WAR PACIFIST"

To THE EDITOR: I have been a pacifist ever since laying aside my childish ambition to go out on the plains and fight the redskins. Even if we admit that all civilization is and always has been essentially and predominantly militant, that war has been the chief and controlling factor, that without war there would have been no civilization; nevertheless it is established beyond a reasonable doubt that, the people having been consolidated into great nations, from war has been obtained all that it had to give, that from now on war is a grotesque anachronism, that those who take the sword shall parish by the sword.

Notwithstanding the absolute truth of all this, just as in our Civil War there were "war democrata," so in the present crisis I am a war pacifist. Because I really believe that those who take the sword shall,

and ought to perish by the sword.

There is no war in all history for which the responsibility can be fixed with greater certainty than for the present war. first overt act of the war was Austria's in-vasion of Serbia; the second act was Ger-many's attack on France and the violation of Belgium; without these acts the war would not have begun. The Germans themselves make no secret of it, except when they are speaking for the benefit of innocent foreigners or mediators. If there is any man who can persuade himself that England, or Rus-sia, or Japan, or Patagonia by deep, dark, underhand plotting brought about these acts —such a man would have no difficulty in working over the evidence in the gospel narratives and reaching the conclusion that Christ betrayed Judas, and that was the real reason why he was crucified.

For two years Germany had been committing acts of war against this country, from the Lusitania with thousands of noncombatants, largely women and children, aboard, torpedoed to make a German holiday, through a long course of sinking our ships and killing our citizens on the hig seas, to the open adoption of unrestricted piracy against us; from attempts to rous up foreign enemies against us and form coalitions with them, through endeavors to paralyze our industries and stir up class strife 172e our industries and stir up class series among us, to successful conspiracies engineered by responsible German officials to blow up our factories and other buildings, and shed American blood on American soil. And yet, notwithstanding all these affronts, insults and injuries, both old and new, both small and great, there are Americans who profess themselves unable to see why we should officially recognize that a state of war exists between this country and the German empire, or why we could not with any self-respect continue friendly relations with a power that openly avows and pursues a policy of perfidy, piracy and atrocity. I suppose there may be Christians who cannot see why Judas Iscariot has been execrated and anathematized through the ages, instead

of being canonized as a saint. But however the war originated, however we came to be in it, we are now in it with both feet, and are assuming a leading posi-tion among the enemies of the Prussian military despotism. There are two possibilities, and only two: we, our side, may win, or we may lose. The war will end either with the United States leading the world, industrially, financially and politically, or with Germany dominating the world. The question will be decided, not by argument or persuasion, but hy force of arms. War is upon us, and so debate the question now, whether war is ever justifiable, is an out of place as it would be to sit down in the midst of a conflagration and engage in a lengthy dem onstration showing what an incalculable blessing was the discovery of fire. It is up to every American, hypbenated or straight natives he favors—the United States leading the world, or the German autocracy dom-inating it. WALTER C. Rose. inating it.
Ashland, Mass.

### THE THIRD COURSE

TO THE EDITOR: Between pacifies on the one hand, and apologists for war on the other, there is another class of people, larger than these two combined, whose position regarding this war is worthy of some attention of the combined of the control of the control of the combined of the com

They desire peace of the true kind; not a passive, supine acquiercence in things as a passive, are considered to the passive, are considered to the consider

Are they right in regarding Prussianism as an ingredient poisonous to olive trees? And are they right in recognizing but one effectual method for its eradication, that of warfare?

They have reached the point where they can no longer harbor doubts as to the first ouestion. They are forced to the conclusion that insofar as we fail to discern the true inwardness of the Prussian moral philosophy, its arrogance, its frightfully shallow pegamatism, its hideous travetay of neo-Darwinism, we deserve the sigma of "diolic Yankees" which they have laid upon us. They have also reached the point where

They have also reached the point where they can harbor no further doubts as to the control of th

The only victory which we of this third class desire is a repudiation on Germaly part of the political and moral philosophy to which she has pinned her faith. Such a repudiation, confirmed in ways that shall satisfy us of its sincerity and effectual permanence, will constitute victory in our eyes. We hope and helieve it will come soon.

[Minister First Church]
Boston, Mass.

### TESTING IMMIGRANTS

To THE EDITOR: It is with no little aston-ishment that I read in your issue of September 15 the digest printed from the Jour-nal of Delinquency for September of this year under the caption Two Immigrants out of Five Feebleminded, for the experience of daily contact of the Council of Jewish Women, Department of Immigrant Aid, with Jewish immigrants on Ellis Island in nowise bears out such a statement. How does this statement of the SURVEY's, "If you had gone over to Ellis Island shortly before the war began and placed your hand at random on one of the aliens waiting to be examined by government inspectors, you would very likely have found that your choice was feebleminded," tally with "Dr, Goddard does not contend that this study reveals the per-centage of all Ellis Island immigrants who are defective"? In another paragraph the "The most favorable interprearticle says, "The most favorable interpre-tation of their results is that two out of every five of the immigrants studied were feeble-minded," This careless summary of the findings omits the most essential fact as to who were studied, i.e., was it a representative group of immigrants, a large group or the special group which Dr. Goddard finally chose?

Sastued," says Dr. Goddard's report in the Journal of Delinguerg, 'the physicians had picked out the obviously feetheminded, and to balance this we passed by the obviously sormal." It would therefore seem that the group left was somewhat subnormal that the group left was somewhat subnormal, so that Dr. Goddard's group would from the start be below par. This, and the fact that 148 persons altogether, or from nationalities represented, is criterly too small a number to constitute a fair sample upon which to base general conclusions, would make the results of the tests invalid if taken to have the significance the Stuxer closhes

But although Dr. Goddard slips up on his conclusions, he does not set out to prove the percentage of feeblemindedness among im-migranis. The problems set for the experiment were: First, whether persons trained in work with the feebleminded could recognize, by simple inspection, the feebleminded im-migrant; second, to what extent, if any, could mental tests successfully be applied to the desection of defective immigrants. The interpretation of the results of the problems as above stated should not be made as bastily as the SURVEY seems to have done. Dr. Goddard himself says: "Our study, therefore, makes no attempt to determine the percentage of feebleminded among immigrants in general, or even of the special groups named—the Jews, Hungarians, Italians and Russians." He goes on with a statement of opinion, proof for which is not given, "So valid, will not give us the percentage of Ellis Island immigrants who are defective, nevertheless the figures would only need to be revised (reduced) by a relatively small amount." It must not be forgotten that the purpose of the study was the testing of the

feasibility of applying mental tests to the immigrant, and that the experiment was conducted with a selected and small group and that therefore the results do not give percentages of feeblemindedness among immi-

grants.

The paper, however, concludes with statements that contradict the earlier assertions. By the use of the Bines-Simon tests it was by the use of the Bines-Simon tests it was grants tested (only thirty-five in number, and it must be kept in mind that the addition or subtraction of one person in so small a group would materially change the result), failed to qualify as normal and would be considered to the state of the smallness of the groups, were about the same. In spite of the smallness of the groups, Dr. Goddard makes the weeping statemen, 'But even do per cent is a startling proportion for the feebleminded among our immigrants.' And again, chewhere in the article, the writer of total immigration.

In his summary nie writer says, "It seems wident that mental tests can be successful used on immigrants atthough much study is still necessary before a satisfactory scale can be developed." Following on the beels of this modest statement comes the assertion, "One can hardly escape the conviction that the intelligence of the average 'third class'

and interingence, we are very security and the control of Jewish Women has been in daily contact with immigrants particularly Jewish and particularly lewish, and particularly lewish, and particularly lewish, and particularly lewish, and particularly women, girls and chillion of the control of the control

Our follow-up work the thoroughness of which can be estimated from the fact that only fourteen were lost, out of the total of 3.623 who have been visited since March, 1915, and which visiting continues while the allen is technically an immigrant, shows that callen is technically an immigrant, shows that came to our notice, are "making good," None not certified have shown a tendency toward feeblemindedness, while one who was certified has since had the certification withdrawn. The conclusion of the Council of Jewish Women, drawn from its experience of Jewish Women, drawn from it

Dr. J. Victor Habermann says: "The Binet method is utterly inadequate to furnish one with either an accurate or truthful equation of the general intellectual ability of the control of the general intellectual ability of the control of the general intellectual ability of the control of the c

different languages, different education or lack of education

Dr. Goddard himself says that even if Dr. Goddard nimeelt says that even it these defectives are morons, it must be due to environment, not heredity, for is an investigation made by himself a few years ago he found that only 4½ per cent of the inmates of institutions for feebleminded were of foreign parentage.

HELEN WINKLER, Chairman, ELINOR SACHS, Investigator. [Council of Jewish Women, Department of Immigrant Aid.] New York.

[It is a bit difficult to tell just where our correspondent's criticism of the SURVEY ends and that of Dr. Goddard begins. We shall We shall confine ourselves to the former, since Dr. Goddard is able to take care of himself. First, it should be made clear that the SUR-VEY printed its digest of Dr. Goddard's article as news: a noted psychologist had said certain things and we undertook to give the gist of his remarks to our readers. If these remarks are astonishing we can only com-

pliment our news sense.

MAN

Clearly, however, this put upon as the obligation to make a correct summary. Our correspondent charges that we omitted "the most essential fact as to who were studied, i.e., was it a representative group of immigrants, a large group or the special group which Dr. Goddard finally chose." On the contrary, we carefully pointed out, first, that both the obviously intelligent and the ob-viously defective had been removed from the group studled and, second, that the group included thirty-five Jews, twenty-two Hungarians, fifty Italians and forty-five Rus-

The chief other question raised by our correspondent comes down to this: Is our interpretation of Dr. Goddard's conclusions, and especially our statement that "the most favorable interpretation of their results is that two out of every five of the immigrants studied were feebleminded" as accurate as a brief digest of a long article can reason-ably hope to be? Barring the title, it is altogether accurate. Our critic quotes only Dr. Goddard's cautionary and modifying sentences. Yet Dr. Goddard said: "Accord ing to this criterion [the special scale detain difficult tests] more than 40 (for all groups it is 39.1 per cent) would be considered feebleminded according to the usual definition. It must be admitted that this gives the immigrant the benefit of every doubt." Again: "Doubtless the thought in every reader's mind is the same as in ours, that it is impossible that half of such a group of immigrants could be feebleminded, but we know that it is never wise to discard a scientific result because of apparent absurdity."

It is perfectly true that Dr. Goddard said It is perfectly true that Dr. Journal of that the results did not give the percentage of all Ellis Island immigrants who are defective. It is also perfectly true that we said he said that. Indeed, always barring that unfortunate title, we think our summary was a very good one.-EDITOR.1

partment as one way in which the state might worthily inaugurate its second cen-tury. Through such a department it could coordinate all existing agencies both public and private; could appoint, in consultation with county judges, unpaid boards of child welfare connecting local communities with the state department; could have some voice in selecting local probation officers and other employes in the public service for children; could register and follow up every ward of the state assigned to guardianship, and could assume the disposition of any case with which the local anthorities knew not what to do; could stamp out "traffic in children" by making it illegal for any other than licensed individuals or agencies to operate a child-caring work; could extend the inspection and licensing of institutions to include all agencies regardless of the source from which the children are re-ceived; could work out safe standards for all such institutions and could also revise and create legislation required to promote

the work of such a child welfare department. the work of such a child wetrare department.

At the end of a century, Mr. Reynolds
concluded, "Illinois childhood is sending forth
its plea that the wailing of children in moral physical distress be heard, that causes and of delinquency and dependency be removed, that strong bodies and feeble minds be found less together, that the anguish and remorse of the socially condemned girl-mother be forever comforted and the paternal rights of her child speedily determined and se-cured, and that in the dawn of a new and cured, and that in the dawn or a new and brighter century, Illinois, as a wise parent, will answer and say, 'You are my children. For your joy and suffering the state is re-sponsible, for your welfare I will provide'."

# Conferences

PUBLIC WELFARE IN ILLINOIS Y two forward-facing features the twenty-second Illinois State Conference of Charities and Correction regpolicies of the state. One was an official event brought to pass to signalize the advent of the Department of Public Welfare, which was created by the recently enacted civil The director, Charles H. Thorne, called together the members of his staff, the superintendents and wardens of all the charitable, penal and reformatory institupartment and the state civil service commission for a first annual conference, the six sessions of which were devoted to consultation of "How to meet the high cost of food, fuel and clothing in the state institutions. Special section conferences were held by the managing officers of the charitable institutions and the penal and reformatory group. In opening the state conference, Governor Lowden struck a high, firm note to which the general and special programs kept well keyed up. The very distraction of the war he claimed to be all the more of a reason for considering "not only old but new social problems," when "better organization of social forces and new methods of efficiency" are demanded to meet the exigencies of the "Specialized scientific forces in our institutions," he declared, "are required as never before." Believing in the principle of promotion, he said, "the greatest efficiency can be attained if any young man or woman going into an institution with heart and soul in the work can come out a superintendent." Efficiency through cooperation rang all down the line of the official conferences like a gen-

eral order from the commander-in-chief with very specific applications to each group.

The one aggressively reactionary note was struck by an assistant state's attorney who declared that parole and probation laws should be abolished, because they encouraged crime, and "punishment should be given to deter others from committing crime, and not for reformatory purposes." He was promptly challenged by Superintendent of Prisons John L. Whitman, whose thirty-five years of successful dealing with the criminal classes gave authority to his declaration that "the old barsh method of treatment of prisoners was ineffective as a cor-rective measure." Will T. Davies, long associated with Mr. Whitman in the Cook county jail and now his successor, defended the parole against its abuse by grasping employers, to whom younger prisoners are paroled and are exploited for low wages until so discouraged as to return to criminal pursuits. The superintendent of the Pontiac Reformatory thought that 50 per cent of the employers take boys under the parole system because it is possible to get them for low wages while they are not in position to protest. Judge Hugo Pam stoutly defended modern penological methods by his experi-Chicago.

Next to these official declarations of policy. the utterance which was most impressive was dent's address on Illinois Child Welfare at the End of a Century,

Prompted by the approaching centennish of the state, he reviewed the development of its past child welfare policy and pro-

### BETTER HOMES FOR CITIES

THE three days' session of the American Civic Association, held in St. Louis, October 22-24, was given over mainly to discussions of housing and to the establishment of parks all over the country. Special stress was laid on the desirability of state parks in the Ozark district of Mis-

Almost every discussion, however, related itself in some way to conditions and problems of war.

Fresident J. Horace McFarland of Har-risburg, Pa., in his presidential message which he called A New Call to Arms, in-dicated the need of "another liberty army pledged to the selection of capable and effi cient men for public service." He spoke of the necessity of men ready to "face ballots as well as bullets" and indicated that the Americans who are neglectful of democratic

institutions at home are giving aid and comfort to the enemy.

A great deal of attention was attracted by John Nolen's speech on Economic Problems of Industrial Housing. Mr. Nolen pointed out the defective housing in American industrial centers, contrasting these conditions with what he had found in the gar-den eities of England, and with the workingmen's homes in Essen and other parts of Germany. He asked the audience to decide for itself for which kind of home soldiers would fight most valiantly.

The officers have been recleeted as folws: J. Horace McFarland, president; John Nolen, first vice-president; Karl V. S. Howland, treasurer; Richard B. Watrous, secre-

### AID FOR OVERSEERS OF POOR

THE Pennsylvania legislature at its last session passed an act authorizing the directors of the poor and other officers having charge of the poor in the various districts

### THE WORLD PERIL

Why we are in the war, and what we mean to get out of it, as explained by members of the faculty of Princeton University, in respect of democracy, international law, commerce, etc. Introduction by President Hibben. The chapters are: "American Rights Imperilled," by Henry van Dyke; "Democracy Imperilled," by Thomas J. Wertenbaker; "International Law Imperilled," by Edward S. Corwin; "The World Balance of Power Imperilled," by Mason W. Tyler; "The World Peril and the Two Americas," by Clifton R, Hall; "The World Peril and American Interests in the Far East," by Mason W. Tyler; and "The World Peril and World Peace," by Philip Marshall Brown. A terrible and convincing indictment of Germany's rulers, a strong and convincing exposition of America's purpose; a clear and convincing statement of our position after the war. One dollar, net; by mail, \$1.06.

### POSTAL SAVINGS

An historical and critical study of the postal savings bank system of the United States, by Edwin Walter Kemmerer. A clear, authentic description of the purpose, the institution and the administration of the postal savings system, with discussion of its relations to other banks and its part in the nation's financial affairs. Net, \$1.25; by mail, \$1.30.

### COOPERATIVE MARKETING

From the experience of the citrus fruit growers in California, the author, W. W. Cumberland, shows what cooperation will do for producers, in getting the best markets, and for consumers, in getting the best goods at the fairest prices. Mr. Cumberland is assistant professor of economics in the University of Minnesota, and manager of the Markets Information Service, Committee on Food Production and Conservation, Minnesota Commission of Public Safety. Net, \$1.50; by mail, \$1.56.

Complete catalogue on request.

### PRINCETON UNIVERSITY PRESS Princeton, New Jersey

districts the annual meetings of the Pennsylvania Association of the Poor and Chari-ties and Corrections "for the purpose of discussing the various questions arising in the discharge of their duties and of pro-viding for uniform and economical methods visuage for uniform and economical methods of administering the affairs of the respective poor districts." As a result of this act the attendance at the forty-third annual meeting at Johnstown, October 15-18, was probably the largest in the history of this asso-

On the program this year, one entire section was devoted to various problems connected with county home and almshouse manage-In the discussion it developed that there is an increasing sentiment against the separation of aged respectable couples when they are committed to the almshouse. A considerable number of the directors of the poor went on record in favor of making every effort to keep husband and wife together in the county home.

At the session on the work of county and state penal institutions, T. B. Patton, superintendent of the Huntingdon Reformatory, stated that only about 13 per cent of their paroled boya violate parole and that they lose track of only about 4 per cent. Superintendent Patton described how the time of perintendent Patton described how the time of the parole and the sentences are deter-mined by the board of managers. F. H. Nibecker, of the Glen Mills School, and William F. Penn, of the Morganza School, told how their institutions seek to adapt themselves to the needs of the boys who assent to them from the public schools when the control of the public schools through the juvenile courts.

The convention authorized the appointment of a committee of seven members to study the question of codifying the 800 separate poor laws of Pennsylvania. They will bring in a report at the meeting to be held next year in Butler, Pa.

Albert P. Roderus, of Pittsburgh, succeeds Oliver P. Bohler as president and Edwin D. Solenberger, of Philadelphia, was re-elected secretary.

### SOCIAL PROGRESS IN IOWA

THE nineteenth Iowa Conference of Char-ities and Correction, held at Mason City, October 14-16, was perhaps the most successful in the history of the organization. Earnestness, enthusiasm, and a sort of family spirit characterized the gathering. extent to which the conference touched the local community was evidenced by the careful and hospitable preparation for delegates and the presence of some fifteen hundred persons at the Sunday evening mass meet-ing. The sessions opened with an address ing. The sessions opened with an address by the president, Paul S. Peirce, on social legislation with special reference to the work of the last General Assembly in Iowa. Throughout the conference emphasis was placed upon the peculiar problems growing out of the war situation, such as civilian relief work of the Red Cross, educational and recreational activities in and about mili tary camps, and the safeguarding of child life against the hazards of wartime

Child welfare was considered from almo every angle, including care of neglected children, in homes and institutions, child placing, children's code-making. Professor Bird Baldwin outlined plans of the child welfare research station recently established at the state university at Iowa City for the investigation of scientific methods of conserving and developing the normal child, the dissemination of the most approved infor-mation on the subject, and the training of students for child welfare work.

For the first time, a session was devoted to rural social problems, as well as to industrial welfare and to community health. Illuminating papers were presented on the Iowa labor situation, rural sanitation, hou lows labor situation, rural sanitation, hous-ing surveys, and library extension for the benefit of rural folk. J. C. Sanders made a telling plea for a national vagrancy law. At the business meeting it was voted to

change the name of the organization to the Iowa Conference of Social Work and to appropriate a small sum towards the effort of the national conference secretary in coop-erating the work of local, state and national

Dodles.

The next conference will be held at Mus-catine, October, 1918. The following offi-cers were chosen; president, H. L. Hough-ton, Sioux City; secretary and treasurer, Bessie McClenahan, Iowa City.

### CIVIC PRIDE IN KANSAS

AT the meeting of the League of Kansas Municipalities, held in Wichita the past week, 129 persons were registered in at-tendance from 48 Kansas cities and towns and from outside the state. Organized originally, eight years ago, as a league of cities, the organization has been broadened to include a place for service for each in-dividual and organization in the state interested in better government and more wholesome community life.

The resolutions adopted by the convention include a strong and unreserved declaration of support of our president and national government in the carrying through of the war for freedom, democracy, and the safety of the nation. Those present also endorsed the permanent income provision for the uni-versity, agricultural college and other schools of the people of the state. In the legislature, the league's committee on legislation actively cooperated in the movement had for the submission of this much needed amendment.

Wednesday morning the various groups of delegates met in department round table

conferences. The group meeting of the su-perintendents of the municipal water and electric plants was especially well attended about twenty superintendents being present

and taking part in the discussion. The city clerks also had a very interesting conference. In connection with the educational campaign of the league for the submission of paign of the league for the aubmission of constitutional amendments for wider powers of home rule for cities, and the initiative and referendoum, the Wichita meeting was significant for the plan of cooperation de-veloped for the state federation of labor and the farmers' organization of Kansas to work with the civic interests of the state.

Representatives of the working men and farmers of Kansas, representing thousands of members, pledged their assistance in an active movement for better city and state

government.

### PRODUCTS OF WESTCHESTER

PRODUCTS OF WESTCHESTER

At the Westchester County Conference
of Charities and Corrections, held in White
Plaina, Ocender 25. Though both are almost
beanstalk growth in warriem placed them
prominently on a program directed chiefly to
warriem social problems. Both, moreover,
have flourished in Westchester the past year.
Beth are giving Westchesteries deep concontrolled to the controlled of the controlled of the
more abundant crop of bad boys is very whereas the erroy of potatoes bids fair to increase until, mayhap, farming Instead of

increase until, maynap, farming instead of commuting becomes the popular county sport. In the absence of V. Everit Macy, county commissioner of charities and correction, and president of the conference, John R. Shillady made a plea for the establishment of a

special court in the county with jurisdiction over children's cases or for the appointment of a circuit judge to sit in different towns and hear the cases of minors. Mr. Shillady described how the present system of dealing with juvenile offenders in county courts clogged the machinery of the courts in their proper duties, and resulted in the ineffective supervision of the children. By way of comparison he introduced Judge J. B. H. Stephens of Monroe county, who told what a special court for children's cases and a staff of twenty probation officers had done to re-duce juvenile delinquency in a county with the same population as Westchester.

The Committee on Children's Courts ap-ointed at the 1916 conference asked that pointed at the 1916 conterence assets to it be continued until it had completed its investigations, with power to draft and propose legislation in the name of the continued to chilference, either for a court limited to children's cases exclusively or to include adult contributory delinquency affecting children.

To take charge of bad boys who grow up to be bad men in Westchester county, the Committee on Legislation recommended the creation of an indeterminate sentence and the appointment of a parole commission. As an example of the efficacy of parole and indeterminate sentence laws, Burdette G. Lewis, commissioner of corrections, New York city, showed by means of a chart how workhouse convictions had decreased since such laws were put into effect last year.

The discussions of the conference switched to food in the afternoon. John J. Dillon, commissioner, New York State Department of Markets, opened the session. He pro-duced figures demonstrating that whereas the farmer gets but thirty-five cents out of every dollar the consumer pays, the mid-dleman gets sixty-five cents. "No farmer," dleman gets sixty-live come, said Mr. Dillon, "will swent to make 'two blades of grain grow where one grew before' unless he has some inducement. commissioner's plan for lowering food prices is to abolish the middlemen, transport food from farm to city under the supervision of state officials, and sell straight from retail stores to homes.

Westchester farmers, however, did not suffer from the pressure put upon them for enlarged cultivation described by Mr. Dillon, owing to the efficient and intelligent handling of the situation by a county commission of general safety. According to the chairman, Arthur N. Lawrence, the commission secured friendly cooperation from the farsecured triendly cooperation from the far-mers by guaranteeing a minimum price for every bit of produce not sold—a guarantee that was never taken advantage of since the farmers disposed of their goods at higher prices elsewhere. As a result of the efforts of the commission, Westchester had a tilled of the commission, Westchester had a tilled 1916, and settings of 18 are sent inspects. acreage of 14,000 as against 20,000 acres in 1916, an average of 18 per cent increase for the county as against 10 per cent for the state as a whole. So many peas, beans, beets and ears of corn were produced in Westchester that a women's committee, headed by Mrs. V. Everit Macy, started a canning campaign to preserve the uneaten food. Over 40,000 jars of vegetables and fruits put up in home and in community kitchens testify to the success of the campaign.

At the tall end of the conference, Owen R. Lovejoy of the National Child Labor Committee, swung back to bad boys by point-ing to the excess of invenile delinquency in foreign countries, caused by the removal of parental supervision, darkened streets, and the relaxation of school and child labor laws. He nrged the maintenance of educa-United States. Maude E. Miner, emphasized the need of wholesome recreation centers near training camps and women patrol offieers to prevent young girls from becoming

Correspo indence is invited by the agencies lised; questions answered (enclose postage for reply) and pamphlets supplied free or at nominal charges. Membership is not required of those seeking information, but offers an opportunity for you to share spiritedly and seriously in your com-munity or profession in an organized movement which is grappling with some country-wide need or cause.

If you are uncertain where to turn. address the SURVEY, and we shall en-deavor to get your inquiry into the right hands.

### WARTIME SERVICE

"HOW the Survey can serve" mal conference held early in April, in our library, to which we asked the exceutives of perhaps twenty national social service organizations. The conference was a unit in feeling that as a link between organized efforts, as a tink between organized egoris, as a means for letting people throughout the country know promptly of needs and national programs—how, when and where they can count locally—the SURVEY was at the threshold of an opportunity for service such as has seldom come to an educational enterprise.

The development of this directory is one of several steps in carrying ont this commission. The executives of these organizations will answer ques-tions or offer counsel to individuals and local organizations in adjusting their work to emergent wartime dcmands.

YOUNG WOMAN, stenographer, bookkeeper, graduate social worker, with secretarial, organized charity and settlement experience open for position. Prefer executive position with social agency. Address 2653 Survey.

# The Fate of the Unprepared

Among the remarkable events of this war no fact stands out more startlingly than the tragic sacrifice of Russia's unequipped soldiers.

The army has been victimized by intrigue and treachery. Gus were sent to the front without ammunition and ammunition without guns. Supplies were provided that when unpacked proved to be rubbish. Left stranded by communications that broke down under slight pressure the brave Russian troops hurled themselves again and again against foes perfectly prepared.

From the very verge of victory they doggedly fell back fighting with stones and clubs and iron bars, resisting heroically but ineffectively.

No thought can be more abhorrent to Americans than that of our boys ruthlessly slaughtered because of lack of equipment or support which it is the first business of us at home to supply.

Our Government, never before so powerful, is working prodigiously in the preparation of armies and means of warfare. Throughout the nation there is a unity of purpose that is piling on the altar of liberty every personal ambition and corporate gain.

Mines, factories, farms, shipyards, the counting houses and shops of every industry are laboring day and night to supply the sinews of war.

The Bell System is co-operating to mobilize production, transportation and communication, and is using its every energy to speed up American defense.

# Invisible Armor

Extracts from an Address Delivered by Newton D. Baker, Secretary of War, at a National Conference on War-Gamp Community Recreation, Washington, D. C., October 23

O army ever before assembled in the history of the world has had so much thought given and so much labor performed in the interest of its social organization. It is no reflection on anybody to thave some sort of inspiring music marched through the street, to have a local oratorical outburst on the subject of the particular cause for which the army was desired, to have young men follow the music and then be taken off to make their own eamps, to make their own conditions, and then to be sent to the battlefront with that much training.

But the United States is a civilized country, Nobody realized how civilized it was until we assembled this army, for instantly there came from all parts of the country a demand that this army should not be raised as armies hitherto had been; that it should not be environed as armies hitherto had been, but that such arrangements should be made as would insure that these soldiers, when actually organized into an army, would represent and carry out the very highest ideals of our civilization. . . . .

For a great many years in America we have been struggling almost despondently with the problem of the large cities. We knew that the large city was economically and industrially more efficient. We knew that by getting people close to the place where they were to work, getting them in large groups, we multiplied the industrial output of the individual. We knew that by getting people into large cities we were able to extend over a wider surface the so-called conveniences of modern civilization: that people could live in better houses: that they could have better sanitation; that they could have better medical care: that they could have freer access to public libraries and opportunities for culture; that they could have better schools. But we realized that we paid a price for the city, and that price consisted in the tempestuous and heated temptations of city life, and every man who has had any opportunity to study city life has had his mind more or less held in a state of balance between its advantages and its disadvantages.

It used to be said that a family ran out in three generations living in a city, and that it was necessary to replenish the vitalty of city-dwelling people by constant drafts upon the unspoiled people of the countryside; and that was, we learned, because of the vices which grew up in cities, and because all of those restraints of neighborhood opinion were gone. A boy in the country was known to everybody of his neighborhood. His misconduct was marked. The boy in the city could be a saint in the first ward, where he lived, and a scapegrace in the tenth ward, without anybody in the first ward discovering it. There was an absence of that pressure of neighborhood opinion, that opportunity to cultivate the good opinion of old neighbors, which was evident in the countryside where conduct was more obvious.

Now, for a long time we tried a perfectly wrongheaded process about the city; we tried to pass laws and to enforce them by policemen, which would cure all these ills. I do not mean that we ought not to have some policemen, but we imagined that our sole salvation lay in the passage of laws and in the employment of policemen. And I can remember when I was mayor of a middle-western city, that every now and then some movement would get its start to have a curfew law passed in that city, to make everybody go to bed at a particular time. Some laws of that kind were passed, and some supreme courts held they were unconstitutional, and some held they were constitutional, but no court had any right to pass on the real fact involved, which was that they were in-effective.

And then all of a sudden the discovery was made that the way to overcome the temptations and vices of a great city was to offer adequate opportunity for wholesome recreation and enjoyment; that if you wanted to get a firebrand out of the hand of a child the way to do it was neither to club the child our to grab the firebrand, but to offer in exchange for it a stick of candy!

And so there has grown up in America this new attitude, which finds its expression in public playgrounds, in the organization of community amusements, in the inculcation throughout the entire body of young people in the community of substantially the same form of social inducement which the American college, in modern times, has substituted for the earlier system of social restraints.

And now that we have these great bodies of young men to consider, we have also the analogies which are necessary to

apply to the task. . . . These boys are going to France; they are going to face conditions that we do not like to talk about. They are going into a heroic enterprise, and heroic enterprises involve sacrifices. I want them adequately armed and clothed by their government; but I want them adequately armed be armor to take with them. I want them to have in armor made of a set of social habits replacing those of their homes and communities, a set of social histis and a state of social mind born in the training camps, a new soldier state of mind, so that when they get overseas and are removed from the reach of our comforting and restraining and helpful hand, they will have gotten such a state of habits as will constitute a moral and intellectual armor for their protection overseas.

You are the makers of that armor. General Crozier is going to make the guns; General Sharpe is going to make the clothes; but the invisible suit which you are making, this attitude of mind, this state of consciousness, this esprit de corps which will not tolerate anything unwholesome, this brand of righteousness, if I may speak of it as such, which you are going to put on them here by making them, as a mass, acquire an attitude towards themselves and towards communities in

which they happen to be, and toward their own country, this pride that they ought to have in being American soldiers, and representing the highest ethical type of a modern civilization—all that you are manufacturing in your armories, in the diamer tables of brivate homes, in the rooms of Young Men's and Young Women's Christian Associations. There are all kinds of places where the sound mind of a community can be brought into contact, in a wholesome and inspiring way, with the soldier group in its process of training.

And when the war is over, and our boys come back, and our cities have strengthened themselves by their cooperation, and we have throughout the country the common feeling that we all helped, and share the pride of having participated in this great undertaking and this great achievement, we shall find that for the after-war reconstruction, for this great remedial process as to which none of us know much, and of which most of us are almost afraid to think, our people are sound and virile and intelligent, that American public opinion has been strengthened and made more wholesome and comprehending, and that America is truly a more united people and understands itself better than it ever did in its history.

# Casual Reflections on the Election

By Mary K. Simkhovitch

HERE were not so very many at six o'clock. My first inquiry, as I picketed on the corner, as to whether a citizen walking by to our election district polling place was going to vote for woman suffrage, was a curiously gentle, "I suppose not." I suppose to didn't.

Centre in New York Evening Past

AT LARGE AGAIN
The Tammany Tiger: "They voted for me."

But 91 out of the 228 vores cast in that election district were for suffrage as against 76 opposed. Fifty-nine of the brethren cautiously refrained from expressing their opinions, and two in their passionate zeal to defeat the amendment wrote "No" in a large, bold hand, which, as in so many cases of headlong interest, negatived their desire. Two hundred and twentyeight voted of the 239 registered. This gave the election district to suffrage. The cautious 59 evidently were not yet prepared to take so fateful a step. It is obvious that they had been asked at any rate not to yote against it.

And the thanks of the women of our neighborhood as throughout the city are due to the Democratic party organization, as well as to a general change in favor of women's voting brought about by reason of the President's message of approval and interest, the fine organization of the suffrage leaders and the great services to the country by women at this time.

For several hours I picketed before turning in as a watcher. "Sure, I'm for the women," was the general reply to inquiries. A few of the 76 opposed looked the other way without answering, but in no case was there the faintest discourtesy. With men of our district, in fact throughout all the working districts, the question was taken in a serious manner that was befitting its great political significance. The shame-facedness of two years ago was totally absent, and even the small boy's old slogan of "suffering cats" was absent.

The plain fact is that though indeed the woman's place is in the home, in our neighborhood it is also so largely in the factory, the workshop, the store and the office that fathers, brothers and sons have long been convinced of the right and inevitability of this great political change. In the case of the Italians of our district, the fact that their women are beginning to work so largely in factories was perhaps the dominant reason for the change in their attitude towards suffrage. "My daughter she works, she must vote too like me." It is indeed obvious.

The New York suffrage vote: Yes, 641,481; No. 547,189

The principal reason for opposing it has been the disinclination to face the new work that political parties must take up. the realignments that may ensue, in fact the political insecurity of the situation. But clearly it was finally decided that it was safe to take a chance. The stronger the organization the safer the chance. We owe a great debt to Tammany Hall as well as to other groups, and if in their case there was an admixture of selfish interest in looking into the political future of the organization, this is no doubt also the case with other groups as well. No lofty political change has ever taken place without such an admixture of motive.

As we watched from the time the polls opened in our district to 2:30 A. M. on Wednesday, the bringer-in of refreshments was almost more popular than any of the causes which we individually espoused. Our Democratic election district captain has an Italian friend who sent in two huge pizzas. A pizza is a kind of huge, round, hot short-cake with anchovies, peppers, mushrooms and cheese on top. This is probably the very best thing ever made even by the Italians. Our policemen woke up, we all dropped our tally sheets, neighbors who were standing on the other side of the rail looked on with envy as we watchers, inspectors and clerks made away with the celestial pies. The coffee and sandwiches the settlement sent over later seemed tame indeed, though they kept us going until the boxes were sealed up and the proprietor of our little store, with charming politeness, bid us a farewell.

One of my Tammany friends who was watching and who thought I showed very poor judgment in being for Mitchel said: "I'm strong for Hylan; Mitchel is the worst of the two." I reflected on this gem for several hours and haven't gotten over my reflections yet. Didn't that sum up a widely spread opinion? Whereas the organization was not deeply pleased at the candidacy of Judge Hylan, it certainly knew it was against Mitchel. I believe the dominant reason to the people at large in this city was what appeared to be the assumption that lovalty was the property of one particular group

Cassel in New York Evening World and not the treasured possession of a great majority of the citizens of this city.

I believe Mr. Mitchel's administration to have been the very best that the city has ever seen in the interest of working people so far, that the city departments have, as a whole, been run in a humane way, and that in a very vital sense this administration has been the "friend of the people." But there's no use in pretending that there is no room for progress. This administration knows it as well as anybody else and acknowledges it. But the people of the city of New York evidently want a change. Even in our solidly Tammany district there were fifteen votes for the straight Socialist ticket and twentysix for Mr. Hillquit. "Gee," said the chairman of the election board, "is the old ninth ward going Socialist!" Let's be youthful and energetic and sensible enough to make up our minds that progress is not the prerogative of any one group, and that in any and all circumstances the human interests of this city can be safeguarded and furthered. Whatever forces for good government there have been in this city exist now and will continue to exist. Some of these forces will lie in the incoming administration and some will not. It is those forces that should pull together the progressive and humane men and women voters of this city to get done what they want to have done, for behind formal government is always a still more powerful public opinion which no formal government can ever afford to disregard.

Women will not be so likely to be partisan as men, though they will of course line up also. But on the whole, an independent public opinion will be fostered by their admission to the electorate. We realize our responsibility and are already preparing to meet it-but that's another story.

Donahey in Cleveland Plain Dealer

"IT IS NOT FAIR" The Ohio suffrage vote: No, 311,764; Yes, 217,663

# Tammany by Default

### By Karl de Schweinitz

<sup>4</sup> ▲ ND who introduced the Gary system?

"Was it a man elected by the votes of the people?
"No, it was Judge Gary, president of the Steel
Trust, who has made millions of dollars out of

In this typical snatch of campaign oratory delivered from a soap box to an East Side crowd by a fourteen-year-old boy are to be found the fundamental reasons for the overwhelming defeat of the Fusion administration in New York city on November 6. There has been much discussion of Mayor Mitchel's wisdom in selecting, or in permitting to be forced upon him, the issue of patriotism. Undoubtedly it cost him the support both of those who were opposed to the war, and of those who felt that during the war free speech had been restricted and reaction had gained in power; undoubtedly, also, it lost him the votes of men who resented what they considered the unfair assumption that any one who disagreed with the mayor of New York was against the United States; nevertheless, with or without the patriotic issue he would have been defeated.

It was not the war which made William M. Bennett, a relatively unknown man, victorious over Mr. Mitchel in the Republican primaries or which gave Mr. Bennett \$1,000 votes in the election, and it was not the war alone which transferred eighty thousand votes from reform to the Tammany candidate, John F. Hylan. Mr. Mitchel's fight upon the patriotic issue was only a symptom of the causes which were really responsible for his defeat.

Even if the Fusion Campaign Committee had been efficient from the beginning of the summer it is seriously to be doubted whether Mr. Mitchel would have won. The election was lost at least two, and, perhaps, three years ago. It was lost first because Mayor Mitchel either was not truly democratic, or was unable to interpret himself to the people of New York, and second, because he did not educate the electorate to the ideals and accomplishments of his administration. Fundamentally, his failure was the failure which has defeated reform everywhere, a failure by which the social worker and the governmental expert must profit if they are to make a lasting impression upon municipal affairs.

The boy who contributed the amazing information about the Gary system plainly believed that the mayor had betrayed the people into the hands of big business; yet students of municipal affairs agree that New York has never had a more impartial administration. Not the facts, however, but what the voters think are the facts, decide an election. The voters thought that Mr. Mitchel preferred the rich to the poor. In the newspapers they read about his attendance at banquets with the notables of the allied commissions, and in the Sunday supplements they saw photographs of him in familiar association with men of wealth and with the leaders of the conservative forces in the country.

It was fitting that the mayor should represent the city at important gatherings. It would be ridiculous even to in-

his is a Soap Box Ag-i-fat-or. Does He Want To See the May-or De-feated? He Does. Why? Be-cause The May-or Pre-vent-ed Him From Talk-ing Se-di-tion and Stir-ring Up The En-emies At Home to Aid and Comfort the En-e-mies That Our Sol-diers Are Fight-ing, a-broad.

PUSION CAMPAIGN DOCUMENTS

This leaf from the Political Primer, written by Porter Emerson Browns and illustrated by Rea Irwin, is an example of the ferried patriotism on which the New York municipal campaign was fought out. Most of the "soap-box agistors" were intensely patriotic Irizhmen. Their criticism of British mirrale in Ireland Fusion speakers to denounce them as "pro-German," with the result that the Irish vote went solidly against Mayor Mitchel.

tinate that a rich man or a conservative man should be taboo to the mayor of New York. The mistake of Mr. Mitchel was that he always appeared in this company. Indeed, it was only through newspaper notices and through newspaper pictures that the people saw him. They had no opportunity to become acquainted with him. They had no opportunity to he had friends among the wealthy. They had nothing tangible to show that he really cared for the poor man. Nor did the departmental heads of the administration come before the people often enough to counteract this unfavorable impression. The men who were governing the city of New York had no direct contact with the great mass of those whom they served so well.

The Fusion campaign managers were probably right in feeling that during the last three or four weeks of the can-vassing an emotional issue was needed. The issue should have been Tammany versus good government. The selection of the patriotic issue was a mistake, because it was not the issue. After a Fusion speaker had finished an appeal to the members of a church club to join the fight against Turk, Teuron and Tammany, one of the audience remarked that he had intended to vote for Mr. Mitchel, but that this attack was ourfair that it had decided him in favor of Mr. Hydna.

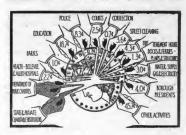

If Mr. Mitchel had been in touch with the people, he would not have accepted the patriotic issue, or he would have presented it differently. In making it part of his platform he identified himself with those who the East Sider believes are exploiting him. It is not easy to speak upon the street corners of New York. One must understand the crowd. And many of the men who have exhorted the people most upon the subject of patriotism have not understood the crowd. Mr. Mitchel in joining the issue was obliged to assume the onus of their mistakes. Added to this were the mistakes of his own advocates. For the most part, they did not know how to interpret patriotism to the street.

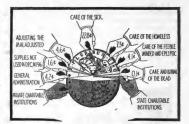

They preached the patriotism of the post-Civil War period. And that is not the patriotism of today. It is said that religion must be interpreted anew to each generation. This same conception might well be applied to patriotism. The campaing speakers, instead of expounding the issues of the war, instead of starting with the point of view of the crowd, and then leading them to a true understanding of the international situation, preached, scolded, threatened and shouted. It was a patriotism of turbulent oratory instead of one of patient exposition and persuasion. "We're for the United States," exclaimed one wearied listener, "but we're tired of being yelled at."

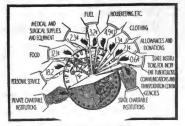

Even if there had been no war, it is doubtful whether without a change of policy the Fusion administration could have succeeded itself. In a municipal election the governing party is at a disadvantage. It is on the defensive. If it rules impartially, that very fact means that it makes enemies. Moreover, its actions so intimately affect so large a portion of the citizenship that the possibilities of being misunderstood are almost infinite. In addition to all this, the ideals of a reform administration are higher than those of the pecolar

The incident of the boy who confused the Gary system with Judge Gary was no less usual an occurrence during the campaign than the objection to the Gary schools by the man whose son had been committed to an institution by the Gery Society (the Society for the Protection of Children from Cruelty), or the inquiry of the woman who asked who the Gary sisters were. In cosmopolitan New York the objection to the importation of out-of-town experts appeared in the heckling again and again, and it was a woman of intelligence and means who said that her husband was taking time from

his office in order to campaign for Mr. Hylan, because Mr. Mitchel was so corrupt. Any one who went about town in the weeks preceding the election, or who tried to speak for the mayor and answer the hecklers, could give scores of other

FUSION CAMPAIGN DOCUMENTS

Admirably written and illustrated with photographs, maps and charts, a small book, Humanizing the City's Charity, etforth one of the major achievements of the Fusion administration. The graphs by Margaret L. Hubbell reproduced above told, for instance, the charittee share in the 1916 budget dollar (top), the charities share in the 1916 budget dollar (top), the charities dollar dissected as to whom it serves (middle), and as to how it serves (bottom). But the report came out so late—almost the eve of election down-that no one had time to read it.

Diseased by Google

instances of the manner in which the accomplishments of the Mitchel administration were misunderstood. This is the handicap with which every municipal administration goes before the voters for re-election. There is only one way of overcoming it, and that is the way of education.

Three years ago the mayor and his associates should have begun a systematic visitation of the neighborhoods of the city. Making use of the various public forums, the social centers in the public schools, the churches, settlements and the like, they should have explained to the people what they were trying to accomplish. They should have invited questions and suggestions. They should have interpreted their municipal improvement in human terms. In three years it would have been possible for the mayor and each of the department heads to have spoken in every part of the city. Even the most casual acquaintance with the men and women who were appointed by Mayor Mitchel would have been an education in reform. It would have shown the people the difference between the Tammany office-holder and the municipal specialist. It would have reconciled them to the few out-of-town experts who took service with the administration. And at the same time, by getting the point of view of those whom they were serving, the men in office would have made themselves more efficient. Something of this sort was indeed done, but in so limited and unsystematic a way as to be insignificant in its effect upon the whole electorate.

Such a program of neighborhood education and discussion would have reduced misunderstandings by anticipating them.

It would have made Tammany's campaign of misrepresentation ineffective. When, for example, the Gary system was introduced into the first public schools, meetings of the parents should have been called. The plans of the administration should have been explained. In conference with the fathers and mothers, many of the inconveniences which became evident later might have been obviated at the start, and the people might have been committed to the Gary plan. It is true that many meetings were held for the purpose of discussing the Gary system, at which members of the Board of Education, eachers, and social workers spoke; but this was after criticism had developed. Moreover, every part of the city was not given the intensity attention that the situation demanded.

This same method might well have been adopted in other affairs of the administration. The difficulties arising from the food shortage might have been dealt with in like democratic fashion.

Something far more fundamental than mere publicity is involved in this. The Mitchel administration had probably more newspaper mention about its achievements and more other kinds of notice than any previous group of reformers. What was needed was the sort of man-to-man discussion with the voters that we usually ascribe to the old New England town meetings—an educational process that not only informs the people, but also enlightens the official. It would have entailed a draft upon the time of the heads of the city departments, but it would have been better to have made what increases in staff were involved than to have failed to fulfill the requirements of democratic government.

It is not to be expected that the voters can remember all the good points of an administration. The average intelligent person who says that Mayor Mitchel's government of the city has been admirable is not likely to be able to mention more than two or three of his accomplishments, but there is a cumulative effect in acquaintance with a group of capable and high-minded officials and in the hearing of stories of accomplishment which builds up a confidence that the insinuation and prevarication of corrupt politicians cannot break down. The weakness of the Mitchel administration was its failure to gird itself round with this armor of popular support, a support that comes only of mutual understanding. Fundamentally, it was the lack of this which enabled Tammany to achieve victory.

Fundamentally, also, it will be a lack of the same sort of confidence that will in turn defeat Tammany, provided, of course, the forces of reform present a united front four years from now.

No administration in a city as large as New York can control enough jobs to decide an election. It must continue in power through the good will of the people. Tammany has never before governed in the interest of the city. Tammany, therefore, is likely to find popular support even more difficult than did Mayor Mitchel.

Tammany's plans for the recent election were started so early that eighteen months ago the outlines of its campaign were generally known. Let the forces of good government profit by this example; preparation for a Tammany defeat in 1921 should be begun now. The people of New York should be educated to what reform has accomplished and what it can achieve. The operations of Tammany must be watched, and the implications of its misgovernment, whether through inefficiency or through intention (the tiger changes its stripes no more readily than the leopard its spots), must be made cate to everybody. Thus a victory for a human, efficient administration may once more be achieved.

Social workers, social reformers and municipal experts everywhere may with advantage study the lesson of November 6. The election in New York has demonstrated once more the truth that no progress is permanent which is not progress by everybody. Improvements in municipal administration and, indeed, in the whole field of social work can be introduced successfully only if they are interpreted and explained to the people. The municipal millennium is to be achieved through education and demorratic discussion.

### THE DEAF MUTE

By Florence Ripley Mastin

He walks within the dim, blue dusk With silent feet.
He's deaf and strange of speech.
The sea is in his gazing eyes,
Dark shadowed, grey and sweet.
He walks alone beneath wide skies
His form is like a withered husk;

Against the sunset cloud he stands
Upon the lonely dunes.
His caged soul flutters down the sands
Where the grey sea croons.
In some blue dusk for him will fall
An hour; unknown to men
His ear will catch the sea's deep call,

How sweet his singing then!

# A Criticism of Tuberculosis Sanatoria

By Samuel Wolman, M. D.

OW at last, after a sincere and arduous crusade, we have many tuberculosis sanatoria—and not a few state-controlled, for the comfort chiefly of the proletariat.

Following close upon the comparative success of the crusade, has come an adverse criticism, maintaining the futility of the sanatorium. Without for the time becoming a partisan in the debate, one would wish, as a spectator of the contest, that the institutions which are being defended were at least doing their best, and not a half best or even less than that. If they are to go down, let them go down with colors flying, knowing that if they are really useless, it is because they cannot be otherwise. But if judgment is rendered against them now, it will be not because of their inherent uselessness, but because their potentialities for good have not been fully developed.

The charges against the tuberculosis sanatoria, especially those for the poor, may be briefly stated because they are not new. But just because the evils are common, and well known, they are much in need of emphasis. These chronic sores must be irritated anew, else they may remain unhealed.

It can be assumed that in a sanatorium, even for the poor, on necessary precaution shall be disregarded for financial ressons; nothing that is valuable in treatment shall be neglected; no contra-indication shall be violated. We in the tuberculosis dispensaries, when we persuade an unwilling laborer to leave his work and enter a sanatorium, freely promise him that there everything that is medically possible shall be done for him; that all injurious factors shall as far as possible be removed from him.

We do not say to him: "Go there. You will get fresh air, but the food will be unpleasant; you may be forced to work when you should really be at rest, but go."

We do not say to him: "It is advisable to be in bed when you have fever; but in the sanatorium, on account of nursing difficulties, you may be forced to walk."

Either we should not make promises or the sanatorium should carry them out. As it is, we are joint partners in this social lie. We charge that the usual public sanatorium does not freely and generously give of what medical science holds to be necessary for the consumptive; and that it frequently contradicts what we have assumed to be its principles.

The importance of nourishing food in sufficient quantities in no greater than the importance of having it pleasing and acceptable to the patient. This is recognized by the relatives, friends and well-wishers of the patient. But unfortunately in many sanatoria, attention is given only to the nutritive aspect of the food and its quantity, while a sad indifference is manifested to its no less important psychological aspects.

In the patient's humble home, every effort is made—and properly—to cater to his appetite. The well sacrifice their own comfort, in order to further the assimilative forces of the sick by attending to the psychic signallings of the stomach. In the sanatorium it is argued that individual attention in these matters cannot be given. Ergo, a mauseating monotony is introduced in the form of a weekly menu as unalterable as the laws of the Medes and Persians.

The guaranteed stability of this dietetic order enables every patient to anticipate with apprehension and loss of appetite the exact arrival of the dish that to him happens to be intolerable. Moreover, the anticipatory distaste irradiates over other food in the same meal which would otherwise be agreeable. Thus the patient is deprived of a most important adjunct to his cure.

I know of patient after patient who has left the sanatorium on account of the food. I know these men to be same, reasonable citizens, anxious to regain their health. These have assured me that everything has been to their satisfaction but that the food was intolerable. The number of patients in the United States who annually desert sanatoria because of the food is not inconsiderable. Nor is this the sum of the mischief. We must not forget that many of those that remain do so only at a cost to their appetite and with a consequent impediment to their recovery. Nor is it too much to say that for not a few patients, the actual decision of life and death thereby goes the wrong way. We must always keep in mind that we are dealing with human life, and therefore what may in itself be trivial assumes huge importance, incapable of exaggeration, and too serious for an artificial sentimentality.

Again, for the treatment of fever in pulmonary tuberculosis, rest in bed is essential. If the fever is more than slight, the rest in bed should be absolute—as much as in typhoid fever, for example. That is, the patient does not leave his bed at any time, and is bathed and fed therein, no matter how well and strong he feels. Often, the fidelity with which this bed rest is insisted on determines whether the febrile patient shall go to his death or to better health. So that this discipline is of supreme importance.

It is, however, the routine in many public sanatoria to have fever patients leave their beds for meals unless they are actually too weak to do so. This culpable regulation is excused on the ground of an insufficiently large nursing staff.

But it is dishonorable not to tell the patient of this sad deficiency in the essentials of his treatment. A man battling for his life is entitled to know that the poverty of the sanatorium is diminishing his chances for recovery. Why should the poor be denied that which the physician of the rich insists on, and rightly, not as a luxury but as an indispensable? The sanatorium should not accept more patients than it can treat honestly; but if it does, it should confess to the patient before admission what a necessary part of the treatment it is unable to furnish him.

Muscular exercise for patients who are doing well is desirable, and perhaps even useful as a mode of treatment. That this exercise should take the form of work facilitating the execution of the many daily tasks of the sanatorium seems economically reasonable and per se unobjectionable. In fact and in theory, the utilization of the patient's labor is unobjectionable, provided that labor is an additional and not an essential element of the institution's routies.

Many sanatoria, however, so arrange the size of the domestic staff that the assistance of a certain number of patients is necessary to keep the sanatorium clean, to carry trays to bedpatients, or to do other needful chores. If we keep in mind that the apportionment of work to a recovering patient is a matter of extremely delicate medical judgment, and that a mistake in the direction of giving him too much or too heavy work, or of setting him to work too early in the course of his recovery, may cause a relapse, perhaps temporary, perhaps lasting and final, we perceive the dangerous position of a patient in an institution which feels that it must have just so and so many patients to round out the number of its domestics.

### Dish-Washing Not a Prophylactic

In SUCH a system the patient is always in peril of not being given the benefit of the doubt when a window needs washing or a floor needs sweeping. It sometimes happens that an insufficiently trained nurse imposes upon a patient subject to hemorrhages a task very likely to bring on another hemorrhage.

Many a woman has had to do more laundering and dishwashing in the sanatorium than if she ran a boarding house. Not uncommonly this task is assigned to a woman who at home has been spared all drudgery by her filial daughters. One patient who was developing tuberculosis of the spine, was forced to fire a furnace, on the false assumption that his groans were counterfeit.

Nor is it of any satisfaction to a patient who has been injured by such a decision to know that his misfortune is exceptional. The system of depending upon the work of the patients is inherently vicious because it lays the emphasis upon getting from them at least a minimum of labor, and not upon getting for them a maximum of safety.

The cure of a tuberculous lung takes a very long time, and in most cases is never completely accomplished. But fortunately an arrest of the disease may mean a happy, efficient life, unharassed by relapses. Therefore, the admitted truth that the sanatorium cannot keep a patient long enough to accomplish his cure, does not excuse the premature dismissal of a patient whose lesion might have been arrested in due time, simply in order to make room for another suppliant, with whom the same sardonic game will be played.

The argument for this futile and expensive procedure is that everyone should be given an opportunity. An opportunity for what? This frantic attempt to maintain a rapid circulation unfortunately creates in the public mind the delusion that there is a sufficiency of beds, when in truth no state has nearly enough. We have enough beds if incipient cases are to be given merely the appearance of health; not nearly enough if the patients are to be ensured a safe return to their homes and to their work.

Remember, we are speaking not of the wealthy incipient case (for whom indeed the regulation six months is often enough), but of the poor factory hand or clerk, who, we know, must return to the task of maintaining his family. As it is, the rich, who return to a life of comfort, have a long residence in the sanatorium; while the poor, who are most in need of vigor, are hurried to the fringe-lines only half rested.

We, in the dispensaries, know as no one else knows, the tragedy of announcing a relapse to a sanatorium graduste. Then it is no time to rehearse the optimistic speeches with which we, a year or two ago, urged him to the sanatorium, promising him health and strength if only he went to the sacred mountain. And this for two sad reasons. First, because he is as disillusioned as we anent the benefits of the pilgrimage. Second, because some sanatoria will not readmit a discharged patient. Perhaps they are afraid of his cynicism. So we may as well not broach the unfortunate subject. In my own state, the sanatorium will not readmit a poor patient, but will accept one who can pay seven dollars per week.

If the present arbitrarily fixed average of a six months' residence is too short for even the incipient case, we may understand the futility of our treatment of the curable moderately advanced patient, who should be given one or two or three years! Can you realize the torture of turning out a patient who is just beginning to have a justifiable hope of health and safety from impending death? Yet this torture is commonly inflicted. And this all the time with the cheerful song on our lips that the state has now done its duty. We show the patient the road to life, then cast him down to death—and thus we do our duty.

And what of the advanced, incurable case? Is there any reason for not keeping him until he ends his days as competably as possible? Or should we return him, as we do, to act as an infecting agent to the workers who must care for him in time stolen from their scant leisure; to the little children, who must find their playroom at his bedside?

The sanatorium ideal must be to take care of all theseand of every one of them adequately: of the curable case until they are cured, of those capable of arrest until they are properly arrested, and of the dying ones until they are decently and safely dead. And if there are not enough beds and assuredly there are not—then sanatorium officials should clamor, continually and pitfully, for more and more, and should not tell the public cheerfully that we have almost enough.

The handling of the tuberculosis situation with the present number of beds can be accomplished only at the cost of preventable suffering to the patients and their friends, and of the production of a deolorable cynicism in sanatorium officials.

It rust the lay reader will not minimize the import of the sanatorium's deficiencies on account of the brevity with which they are here recited. My purpose has been rather to stir the conscience of the initiated by a summation of the familiar than to expatiate upon the obvious. For no one immersed in tuberculosis work will question the need of agreeable food, of bed rest for the febrile, of extreme caution in the assignment of exercise, of expertness in the treatment of complications. But a few words to the laity emphasizing the significance of these needs may not be amise.

### The Cause-Lack of Money

THIS criticism of sanatorium management is not written in bitterness, nor as an attack upon any one person, board or sanatorium. It is written with the inevitable emotion of one who is perforce aware of the misfortunes of the tuberculous poor. I do not imply that the faults I have pointed out are all true of any one sanatorium, nor that any one of the criticisms is always applicable to any one institution. Various sanatoria have varying deficiencies-no doubt unwittingly, certainly unintentionally. And even excellent institutions have occasional lapses from virtue. But in this matter, sins of omission, too, are heinous. The purpose of this sketch is to focus not a bitter but a kind attention upon our public sanatoria on the part of the public, because, after all, the deficiencies are due largely to the lack of financial support. At the same time we do blame the sanatorium officials and representatives for not keeping the public and its legislature and governors constantly informed of the imperative needs of our tuberculosis hospitals. Let us not foolishly lull the somnolent conscience of the keepers of the public purse into a wicked sleep. Rather let us with tales of truthful wrongs rouse that conscience to vehement action.

The practically minded will at once ask—what is the remedy? The remote remedy is obvious—full financial support from the public and the state. For all of the defects above described are, in the last analysis, due to inadequate funds. But adequate financial support will be obtained only after many years of public agitation, preceded, of course, by the formation of a proper public sentiment.

The real question by which the critic of the sanatorium is at once confronted, however, is not the remote, but the immediate remedy. What is to be done now? The answer, although unpleasant, is the only one which is compatible with medical ideals, and the only one which in the long run will make for real progress—and that is the sanatorium must not accept more patients than it can honestly treat. By pursuing this course, the sanatorium will really help those that can be helped and will not incur the waste attendant upon the premature discharge of patients. And more still, the public will have brought home to it that funds are inadequate, when it counts the number of applicants who must be denied admission.

because the institutions have not the means for the adequate treatment of them.

The only defense of the short term that has been resorted to is that the object of the sanatorium is not the cure but the education of the patient. Knowing as we do the kindly medical attitude towards patients with incurable diseases, we can be sure that this enthusiasm for educating the dying rather than for nursing them has been a false enthusiasm forered by financial desperation, rather than one honestly preferred over the usual medical attitude. That such a false enthusiasm may become a fixed attribute both of the medical and of the lay mind, is not the least of the dangers attendant upon the supine toleration of the present inadequacy of funds and solicitude as to the tax-rate.

# Community Health on a National Scale

By Louis I. Dublin

METROPOLITAN LIFE INSURANCE COMPANY

USTRALIA has been an experiment station in practical sanitation as well as in social legislation. America can profit from this experience all the more because the commonwealth of Australia is constituted in many respects like our own. The similarity in the form of government, the predominantly English race stock, the mixture of races from many sources of recent immigration, and the likeness both in the wealth of natural resources and other geographical conditions, make the parallel with America very striking indeed.

Recently reports have reached this country from the committee appointed by the government to consider "causes of death and invalidity in the commonwealth." These reports, discussing typhoid, diphtheria, tuberculosis, venereal diseases, and the risks of middle age, recount a remarkable achievement in the community control of disease.

The outstanding fact in these reports is the very favorable mortality. The general death-rate for males was, in 1914, 11.7, and for females 9.3, per thousand living. In our own registration area the corresponding rates were 14.5 and 12.7 per thousand. That the Australian figures are not spurious is indicated by the good registration conditions in the commonwealth.

The effect of the age distribution is more difficult to consider. Like our own northwestern states, Australia is peopled with young men and women and has not as yet its normal proportion of aged persons whose death-rate is highest. Standardization for age should very appreciably raise the death-rates quoted, but they would still be lower than the American figures. It is, therefore, especially instructive to find that the authorities of Australia are not content with present conditions, but are planning extensive programs to lower still further their rates in the future.

The infant mortality rate in 1913 was 7.2.2 per thousand infants born alive. The lowest rate ever recorded for Australia was 68.5 in 1911; New Zealand had a rate of only 51.4 in 1914. In the United States, 100 infant deaths per thousand births is considered a very good rate and is attained even now only by a few of our most progressive cities. The low infant mortality rates of Australia are, moreover, coupled with fairly high birth-rates. In 1914 this was slightly over 28 per thousand with considerable variation in the several

states. As in European countries and in the United States, the birth-rate is falling, having been as high as 44 per thousand living in New South Wales in 1864, and 38 in Victoria in 1870.

The Australian committee has apparently understood the causes of the past outbreaks of typhoid fever and has outlined a most comprehensive program to control the spread of this disease in the future. The measures of control outlined are exactly those which have proved effective in the United States and in Great Britain. These include the introduction of water-carriage methods of sewage disposal, improvement in the machinery for obtaining early notification of active cases, the more extensive provision of hospital accommodations, the use of methods for the early discovery of carriers and their control when discovered. The death-rates from typhoid fever have been much improved in recent years. In 1890, the rate for the commonwealth was 37.8 per 100,000 living; in 1914, this rate was reduced to 12.3. The lowest rate is found in Tasmania, 5.5 per 100,000, with Victoria a close second, 7.5, although in 1890 the latter gave the highest rate, 54.5 per 100,000. The general conditions in the commonwealth compare favorably with the very best conditions in American states and cities.

As in the United States the death-rate from diphtheria has been lowered since the introduction of antitioxin; the rate is only one-quarter of what it was about twenty-five years ago. On the other hand, the disease is more prevalent than ever. Equally disquieting is the fact that during recent years the death-rate has tended to rise alightly. In 1914, the death-rate per 100,000 from diphtheria and croup was 14, which compares favorably with our rate of 17.9 in the registration acre in the same year. A valuable discussion is given of the control of carriers, which is largely in accord with our own best practice.

The report on tuberculosis is especially instructive in view of the statement, which was recently given wide circulation in America, that certain sections of Australia had virtually succeeded in eliminating tuberculosis as a health problem. In the entire commonwealth the death-rate from tuberculosis (all forms) was 73 per 100,000 in 1914. This rate is 27.7 per cent lower than the corresponding one for 1905, and 52.3 per cent lower than our rate for the registration area in 1914.

This is a splendid achievement, but it does not mean that the spread of tuberculosis has been controlled. The state of Victoria, which was singled out by Dr. Heiser, had the highest rate in the commonwealth in 1914, 86.4 per 100,000 living. This is, however, a 33.3 per cent reduction since 1905. The lowest rates were found in Queensland, 49.6, and in Tasmania, 57.9. The rate for New South Wales was 73.3 per 100,000.

The committee is still of the opinion that the existing rates are unsatisfactory, in view of the lack of congestion, the separate housing of families and the high wages current. An instructive discussion of the full plan of control is given in the report. Very valuable is the suggestion that the commonwealth government cooperate with the state government in a vigorous campaign against the disease in any locality in which it is more than ordinarily prevalent. This would serve as a practical experiment on a large scale and would indicate measures which might usefully be applied elsewhere. In some respects this resembles the American experiment at Framingham, Mass.

The committee is well aware of the importance of venereal infection as a public health problem. They point out that few deaths are certified as due to syphilis and gonorrhea and to the allied condition of alcoholism. Following a method of estimation used in the city of Paris in 1910, it is computed that 7,189 deaths in the commonwealth were caused by syphilis in one form or another. The figure may well be an over-stimate, but even if it were only 50 per cent true, it would still equal the number of deaths reported from all forms of tuberlosis. This should demonstrate to health officers the importance of attacking the venereal diseases as all other infectious diseases have been attacked. The committee advocates a vigorous campaign of education. They recommend also that the quack must be entirely eliminated in the treatment of

venereal diseases; that every medical practitioner must report to the health authorities all cases coming to his notice; that the health authorities must grant bacteriological or other examination required by practitioners for patients; that persons who suffer from venereal disease in an infective form and who do not place themselves under the care of medical practitioners be interned until no longer infective; and that the government must give hospital care and other requisite accommodations for the reception and treatment of venereal cases.

The report on risks of middle age recalls vividly the discussion in our own country on degenerative diseases. The committee is much concerned with the heavy mortality after middle life from causes due to high blood tension. An interesting presentation is made of the deaths from apoplexy, from pneumonia, from Bright's disease and from organic heart disease. These deaths are attributed to severe muscular exercise, to nerve strain, to faulty diet, to overindulgence in alcohol and tobacco and to syphilis. Realizing that the measures against these diseases of high tension must be indirect, the committee recommends that the system of medical inspection of schools be expanded so that physical defects may be corrected in early childhood; that inquiries be made into occupations involving unduly high tension; that provision be made to encourage the early diagnosis and treatment of high tension, and that there be a system of oversight of the health of industrial workers correlated with provisions of temporary relief when necessary; also that the present legislation and regulations concerning the sale of alcohol be reconsidered. Interesting dietaries are given which are very similar indeed to those recently advocated in our own country.

The reports seem to give a comprehensive outlook on health standards and achievements of this progressive democracy of the farthest corner of the world.

# Dope Poisoning

# A New Industrial Hazard in the Making of Airplane Wings

By Alice Hamilton, M. D.

ORE or less vague references are occurring in magazines and daily papers to a new form of industrial poisoning from the manufacture of airplane wings, which, so it appears, has caused war. The question arises, How far has it constituted a danger for the workmen engaged in preparing the wings for America's twenty-two thousand new airplanes?

To discover just what the danger was, the Bureau of Labor Statistics asked me to make a tour of the eighteen factories which were making airplanes during this last summer and to report on the kinds of dope used and the conditions under which it is used. A brief abstract of this report has just appeared in the Monthly Review of the bureau. It is pleasant to be able to say that on the whole my findings were reassuring. We do not seem to be faced with the danger of repeating the experience of England and Germany in dope poisoning, because our manufacturers, encouraged by the War Department and the Bureau of Standards of the Department of Commerce, have wisely decided to begin at once using the safer kind of door which the British adopted last January, after their distressing experience with the dangerous ones.

Done is a compound applied to the linen which covers most of the structure of the airplane for the purpose of tightening the fabric and making it durable and waterproof. The base of dopes is a cellulose compound, either the acetate or the nitrate, neither of them poisonous, but dissolved in more or less poisonous volatile solvents. Cellulose acetate dope is the one which gave so much trouble in England and in Germany, and was responsible for the dope poisoning of which we read. This is because the best solvent for cellulose acetate is tetrachlorethane, sometimes called acetylene tetrachloride, which is closely related to chloroform but four times as poisonous. The effects show themselves chiefly in the liver, kidneys and heart, and the occupational poisoning is called in the British reports, "toxic jaundice." It is the same as the toxic jaundice resulting from trinitrotoluene poisoning [the SURVEY for September 15, page 533], and is really an acute degeneration of the liver, together with changes in kidneys and heart muscle. Milder cases have gastrointestinal trouble or, in some cases, purely nervous symptoms.

Before the war, England, France and Germany were all apparently using tetrachloride dopes. It is always difficult if not impossible to get any information as to such matters from France, but from England and Germany reports of trouble among dopers began to come almost simultaneously in 1914. In Germany, poisoning was first discovered in a plant in Johannisthal where out of a force of eight dopers four were poisoned and one died. Then there were ten men poisoned in another factory with one death. This led to an analysis of dopes in the University of Berlin and animal experiments which established the fact that the poison responsible was tetrachlorethane. We have heard nothing more about this from Germany since early in 1915, and we do not know whether the recommendations of the scientists and the factory inspectors, that the use of these poisonous dopes be forbidden, was ever carried out. If they were not, then there must have been a great deal of serious industrial poisoning in German airplane works during these years of enormous

From England frequent reports have come up to the beginning of this year when the use of tetrachlorethane dopes was finally abandoned, the army and navy calling for only those dopes approved as comparatively non-poisonous. In England as in Germany the first cases of poisoning among airplane dopers surprised and bewildered both doctors and employers. It took careful analyses with experiments on animals to discover which of the dope solvents was the cause of the sickness, for these dopes usually contain, in addition to the tetrachlorethane, other volatile poisons such as benzol and various alcohols. I cannot give the exact number of cases of toxic jaundice in England, but early in 1916 there had been some forty-three, with seven deaths, five of them women. As small an amount as 10 per cent of tetrachlorethane was said to be dangerous, and English and German dopes contained from 40 to 84 per cent. As I said, England now uses only the safer varieties of dope.

These safer dopes have as their base cellulose nitrate and the solvents are acetone (almost non-poisonous if not quite so), amyl acetate which we know as "banana oil," benzol, wood alcohol, fusel oil, and others less important. This means, of course, that such dopes are not really safe, for all the above are volatile substances having some effect on human beings and capable of absorption both through the skin and through the lungs, but they are not so dangerous as tetrachlorethane. Benzol is much the strongest. It is a dangerous poison, but it is not used in great quantity in airplane dope. Amyl acetate has a disagreeably sweet heavy odor and it makes the eyes water and the throat dry so that workmen often complain of it and prefer the tetrachlorethane dope which is a slow, subtle poison and does not show its nature at once. Wood alcohol is the most important of these solvents, next to benzol, for it may have, even in small doses. a harmful effect on the eyes.

#### An Industry of Small Shops

THE eighteen factories which I vaited last summer were some of them tiny places, employing only one man in doping and for only part of his time. Most of them employed at the most two men and only three were large enough to give continuous work to more than ten dopers. However the industry is expanding all the time and doubtless by now the number is decidedly larger than this. I found the men in charge quite aware that doping carried with it dangers to health, though most of them did not know which were the solvents to be dreaded and several were sure banana oil was solvents to be dreaded and several were sure banana oil was

the most dangerous. The adoption of the nitrate dopes which I found in all but five plants—two of these very small—seemed to have been decided on for other reasons than that of its safety. The doping rooms were usually fair, rarely bad, rarely excellent. I think that during this winter those managers who are now trusting to natural ventilation will find that they must install good exhaust systems for the fumes, even if they are using nitrate dopes, for with doping increasing as it is, windows cannot be relied on for sufficient air supply in cold weather. It is quite possible that our experience during these coming months may show us that nitrate dopes can give fairly serious trouble, even if they are not so poisonous as the acetate dopoes.

#### Some Sickness But No Poisoning

I DID not find any evidence of toxic jaundice in airplane works, though our plants all used tetrachlorethane dopes at first. Of course this is not proof that none has occurred. American physicians had no reason to suspect, until recently, that such a disease might be caused by work in an airplane shop, and they would not have thought toxic jaundice in a doper had anything to do with this occupation. Still, I doubt very much that there have been any such cases.

The Bureau of Statistics and Information of the New York State Industrial Commission, in their bulletin for June of this year, publish a report of the inquiry into the danger of the airplane industry in the eight factories in that state, two of which used textendiorethane dope. Their physicians, Dr. Ross and Dr. Bell, examined fifty-two dopers and found some disturbance of health in thirty-five; but no characteristic case of tetrachlorethane poisoning was found.

There are several reasons why our dopers, though using dangerous dopes, have escaped the troubles suffered by the English and Germans. In the first place, they have never been exposed to dope poisoning for a long time continuously. I found that out of fifty-three dopers only five had worked as long as a year, and only thirteen for more than six months; seventeen had been doping for less than a month, twelve for one to three months, and eleven for three to six months. Even in this short working time, they had usually been exposed intermittently only, perhaps a few hours out of the day, perhaps two or three days in the week. This is the principal reason why we have had so little dope poisoning. Another is to be found in the fact that much of the doping has been done in the open air. Doping rooms are being built now, but sheds or the yard were formerly the rule. There were few wings in process of doping, few stacked about in process of drying, few men doping at the same time, so that the fumes were not heavy

All these favorable factors are disappearing, and it may be that the air of full doping rooms will produce harmful effects on dopers who work all through their day in that atmosphere. The solvents I have described are not thoroughly understood as yet by special students of poisons and may prove to be more serious in character than we now suspect. This coming year should teach us a good deal about them. We shall be carrying on in our airplane industry a human experiment on a large scale in the effects of amyl acetate, acetone, benzol, methyl alcohol and fusel oil, and the results may be quite unexpected. For the sake of the dopers we shall hope that the experiment may turn out to be negative-as it probably will if intelligence and care are used in the doping room. At any rate, we need not fear that American airplane works will be responsible for toxic jaundice in dopers, for the few factories which still use acetate dope will probably soon adopt the safer

## Book Reviews

MEDICAL DISEASES OF THE WAR

By A. F. Hurst, M. D. Longmans, Green
& Co. 151 pp. Price \$1.75; by mail of & Co. 151 pp. the SURVEY, \$1.85.

SHELL SHOCK AND ITS LESSONS
By G. Elliot Smith, M. D., F. R. S. and
T. H. Pear. Longmana, Green & Co. 135
pp. Price \$1; by mail of the Suxvey, \$1.10.

Will the publication of such a book merely cause alarm, both for friends at home and for men who must go? Will it but irritate existing wounds? anthors of Shell Shock ask these questions in their preface. The topic is painful, they acknowledge; one of the most grievous aspects of the war. Yet there is a greater consideration. As a result

of the attitude still maintained by the British of the attitude still maintained by the British nation as a whole toward even the mildest mental abnormality, much exaggerated distress of mind exists among the friends of soldiers who have suffered "shock." Whereas in the millitery hospitals such successful work in many of these cases of all mental distributions that has benefatished methods the last has benefatished method become disorder-that is, the scientific method known as psychiatry.
This is the reason why Drs. Smith and

Pear publish their book: that the anxious may have encouragement, the soldier be given confidence and a demonstration made to the entire nation of the proper way to care for cases of mental illness. For civilian sufferer as well as military may have that worst of all fears, the fear of the unknown, dispelled by being helped to understand his strange sensations, symptoms for the most part unusual only to himself. And in this newly gained self-knowledge the man hews

out his own path to health.

A soldier who has lain buried under the debris of a mine explosion for some time, georis or a mine explosion for some time, perhaps overcome temporarily by asphyxiating fumes, has not "lost his senses." On the contrary, his senses are painfully alert. Light and sound are anguish to him. He knows that he is not reacting to them as normal people act. The symptoms which he perceives in himself are associated in his

mind with madness. Therefore, he reasons, I must be mad, too. And this may indeed be the end if the relief of self-understanding be not brought promptly to him. Such treatment demands the special hospital, with its proper degree of isolation; the trained psychiatrist, knowing just the right blend of "sympathetic firmness," and the technique of that penetrating attention which, seeming to follow the patient's lead,

yet leads him further on toward self-interpretation.

Actual functional disorders-deafness mutism, or blindness, or all three successively or at once, resulting from shock-must be treated according to the need of the individual case, say Smith and Pear. These physicians report less enthusiastically than does Hurst the value of hypnotism in such cases. They consider that hypnotism alone should never be regarded as sufficient treatment, though it may undoubtedly be of assistance. In-

stances are given of the disappearance of such functional troubles, as that of the sol-dier who, blind from shock, recovered his sight on being thrown into the water, and the two cases of mutiam cured simultaneously by the report of Rumania's entry into the wer. The antics of a film comedian cured a case of deaf-muism, whose first auditory sensation was that of his own laughter. A patient of Hurré's regained his spaces, so make the same that the same t

Drs. Smith and Pear make this war experience the basis of appeal for improved methods of treatment at home. Discussion of that very important document, the report of a committee appointed in 1911 to consider recommittee appointed in 1971 to consider re-forms in the treatment of insane in Great Britain and Ireland, and published in July, 1914, was prevented by the momentous events of war. But war has only intensified the plea for saner methods. England, say the authors of Shell Shock, is far behind France, authors of Shell Shock, is far behind France, Germany and America in her attitude co-ward mental disease, in her provision for carly treatment, and in her facilities for research in psychiatry. The nation should mark the lesson so sternly tample by the war, and learn by the illustrations of improvement of these soliders whose experience of shell shock is in many cases only the last straw needed to break hem down, how sane and sure may be the scientific treatment of mer tal disease, how important it is that aid be

given early.

Dr. Hurst discusses also certain common diseases in the war, such as trench fever, dysentery and paratyphoid, and shows how infections received at this time may linger and revive through many years in other forms. Both books are proof—were proof needed—of the nations' need for medical ficers of highest training and caliber; they challenge every country to guard its health and prepare to guard it better, for the sake of the common weal, social as well as phy-sical. Gerrupe Sermour.

THE MOTHER AND HER CHILD

By William S. and Lena K. Sadler, A. C. McClurg & Company. 456 pp. Price \$1.50; by mail of the SURVEY \$1.62.

This book is written for mothers, fathers In sook is written for mothers, ranners and everyone who has to do with the care of the child. It consists of three parts: Part one, dealing with the mother until the birth of the child; part two, with the infant until the weaning period; and part three, with the problem connected with the care and bringing up of the child until adolescence. It therefore covers a larger field than most of these treatises for the laity, which confine themselves either to the welfare of the child or of the mother.

The book can be regarded as a success as it is both entertaining and instructive, and it contains a surprisingly large amount of material tinctured with good common sense. It can, therefore, be recommended to those

to whom it is addressed.

As in every book, there are some things which the reviewer would prefer to have somewhat different. In this connection it would seem that it was hardly necessary to describe the length and technique of twilight sleep, but would have been quite suf-

ficient to pass judgment upon its defects and advantages.

Again we would have liked to have seen more greatly emphasized the grave danger of infection to infants through to-berculous mothers or attendants. It would likewise appear that the advantages of wet nurses are rather underestimated.

However, these defects are minor and few and, no doubt, will be looked after in a subsequent edition. The book can be highly recommended, and will most certainly be helpful to many mothers and a source of comfort in times of trouble.

ALTED F. Hess.

This Book of Hoses Numsium P. Prances Campbell. E. P. Dutton and Company, 271 pp. Pries \$1.25; by mail of the Suxway \$3.15.

Have you had an invalid in the home or someone who is side, but not sick emough to require the skill of a trained nurse?

The state of the skill of a trained nurse? The skill of the skill of a trained nurse? Breaspay your big brother has brotten his leg, or your sister is exhausted, and the doctor says she must stay in bed and be made comfortable and rest. Do you feel that it is hardly necessary to go into the expense of side-room utensils for this about that are comfortable in he shell as emissated to the best way to kept track of the medicines or how to effect quarantine in a minor contagious case, if you have forgetten how or now to effect quarantine in a minor con-tagious case, if you have forgotten how to sterilise milk, or make gruel, then The Book of Home Nursing, by Frances Campbell will be a real friend to you. The chapter will be a real friend to you. The chapter on emergencies deserves your especial at-tention, for it touches upon the accidents of everyday home-life, and gives instructions that can be carried out in an average house-

Writing in an easily readable style with now and then a little flash of humor, Mrs. Campbell has brought together simple every-day facts that should be of great value to one who, unused to the profession of nursing, is suddenly forced to think and plan for the comfort of an invalid.

JANS E. HETCHCOCK.

SANITATION PRACTICALLY APPLIED

By Harold Bacon Wood, D. P. H. John Wiley & Sons., Inc. 473 pp. Price \$3; by mail of the SURVEY \$3.20.

The author defines his book as a "corollary to the numerous excellent treatises on the theory of hygiene, and the laboratory manuals." His audience is primarily the man in the field, who is anxious to know exactly how this task of sanitation of homes, factories, schools and communities actually been accomplished, that he may profit thereby. But the employer, too, and the employe, business manager and public official will find practical direction in the well printed pages. Here, too, is enlightenment for the student of affairs whose interest has been aroused in this movement for a new and thorough public health and

It seems to be part of the author's creed that the work to be done is of more importance than the agency to do it. In the chapters on housing and school hygiene, for example, he avoids reference to the debated question whether these are in the bailiwick of the department of health or that of education or of the building commission or other municipal bureau. There is no mistaking his conception of what should be done, however, by whichever local agency has, in the present organization of society, the responsibility for these things

That Dr. Wood's pages have a convincing quality as well as a clearness of detail, is hardly remarkable when one recalls his ex-perience in public health work in western cities and in the state departments of Mississippi and West Virginia.

How to Avoid INFECTION

By Charles V. Chapin. Harvard University Press. 38 pp. Price \$.50; by mail

of the SURVEY, \$.55 When sanitarians of earlier years used to say that for every death from typhoid fever some one ought to be hing, the "some-one" really meant the councilman, health officer or landlord who had allowed the defective sewerage to go uncorrected. The modern sanitarian offers to the victim him-self a share of the hlame for his discomfort. For good health is not simply a matter of medicines and cures; it is to a strikingly large extent a matter of everyday informa-

tion and common-sense. Not often is the needed authoritative information made available in a form so compact and so interesting as that of Dr. Chapin's little pocket volume. It illustrates the changed emphasis from cure to prevention; from the dread of germs to the confi-dence that they can be avoided. Science, true enough, has discovered some disagreeable facts; it has also blazed a plain trail from uncertainty into truth, and the marks of this trail are Dr. Chapin's subject.

PREVENTIVE MEDICINE AND HYGIENE (Revised Edition)

By Milton J. Rosenau. D. Appleton & Company. 1374 pp. Price, \$6.50; by mail of the Suavey, \$6.35.

This is a special "military edition" of Dr. Rosenau's splendid book reviewed recently in these columns. By far the larger portion of the book is the same as in the earlier edigas poisoning, war nephritis, shell shock and others, will be read attentively by many who are looking for careful pronouncements on these matters. There are also discussions of the organization and duties of the sanitary corps, sanitation of harracks and trenches, personal hygiene of the soldier, and other practical desiderata that have value for the layman—he is a civilian, these days—as well as for those in actual military charge. One thing is amazingly evident: The

One thing is amazingly evident: I he measures to control and to prevent disease are very largely identical in camp or in villages. Sanitation is essentially but little affected by political embroilments, save as these emphasize more urgently than "educathese emphasize more urgently than "cutca-tional campaigns" of calmer days have usually done, the worth of human health. Certainly a fresh grip is given that time-dulled slogan, "the war against disease."

HEALTH AND DISEASE: THEIR DETERMINING FACTORS

By Roger I. Lee, M.D. Little, Brown & Co. 378 pp. Price \$1.75; by mail of the Survey \$1.91.

Suit a medical examiner at one of the re-cruiting stations, recently, "It is just as important to know what is the normal as to detect disease." Such an ideal seems to have detect disease." Such an ideal seems to have been in Dr. Lee's purpose when he wrote the present volume. For he gives not so much symptoms and treatments as condi-tions out of which symptoms develop. And he lays emphasis on the significance of these conditions for the community quite as much as for the individual.

Sane, comprehensive, interesting and up-to-the-minute are the chapters on such fato-the-minute are the chapters on such ra-miliar themes as air, food, exercise,—chap-ters, be it confessed, to which one turns with apprehension of ennui. Dr. Lee clas-sifies the more common diseases which he discusses according to the conditions out of which they may come, conditions so fa-miliar as to breed too often a fatal con-tempt. One feels that, at last, the subject is set upright, solid, and on its feet. Satis-factory, too, it is to find that within the range of auhiects in which the community's interest is presupposed, are both occupational diseases and the activities of a department of health, including school hygiene and vital

TITE PROBLEM OF THE UNEMPLOYED By W. S. Williams, M. D. Present Day Problems Series, Richard G. Badger. 106 pp. Price \$1; by mail of the Suaver \$1.06. The Right to Work By J. Elliot Ross, C. S. P., Ph. D. Devin-

Adair Co. 106 pp. Price \$1; by mail of the SURVEY \$1.10

Two books on unemployment, after more than two years of unprecedented industrial activity, at a time when public interest is absorbed by the conduct and issues of the war, both books dealing with the subject as a permanent social evil and discussing its industrial as well as its personal

aspects-though both are written definite religious appeal-this signifies, indeed, a hreak with the American tradition of laisses faire between crises which com-

or latinar jaw between these which coal-pel popular attention.

The general motive and subject matter apart, however, the two books have little in common. Mr. Williams' essay is rather a superficial affair. His material is, for the most part, antiquated and ill digested. His presentation is hazy and full of mis-statements. His unsound economics are fla-vored here and there by unsound theology. Anarchist teaching, the movement for a shorter working day and industrial disputes are jumbled together with more plausible explanations as causes of unemployment.

He believes that Germany has a compul sory system of insurance against unemp ment and that the British system of labor exchanges was modeled on a German ex-ample. He is misinformed on the manner ampie. He is misinformed on the manner of its operation and speaks of its results as something to be expected in the distant future. He is almost a decade hehind in his knowledge of legislation and social movements, such as vagrancy laws and mothers' pensions, in this country. He advo-ates prohibition of the industrial employment of women and the placement of the children of the "submerged" in institutions. Mr. Ross defends the right to work as

an essentially Christian doctrine, in line with the teachings of the early fathers. He presents both a remedial and a preventive program, in essentials consistent with the ing the need for machinery which would stop the drift of sober and normal workers into the class of the unemployable. He supextension of public provision for organizing the labor market, including a national agency which would add to the mobility of labor.

In telling phrases the author stigmatizes an industrial education which makes no effort to maintain a proper ratio between supply and demand in a given trade. He would legislate against overtime to make would legislate against overtime to make possible a wiser planning of production and shares the belief, increasingly gaining ground, that fluctuations in employment can be materially lessand public works with a view to maximum ab-sorption of labor at times of industrial depression. This book is to be recommended

both for its careful diagnosis of the evil and for its thoughtful contributions to the formation of a national policy.

PATRIOTS IN THE MAKING-WHAT AMERICA CAN LEARN FROM FRANCE AND GERMANY By Jonathan French Scott, Ph.D. D. Ap-pleton & Co. 263 pp. Price \$1.50; by mail of the SURVEY \$1.60.

This volume is a cursory examination of education in France and Germany during the nineteenth century, with a view to es-timate how successfully and how wisely these countries have taught the spirit of patriotism to their people. Five of the total is given to Germany, while the remaining three are devoted to a presentation of the lessons which we should draw from French and German experience.

Dr. Scott's study of educational tenden-Dr. Scott's study or educations: tentactics in modern France, though reasonably complete, is not especially clear. Much less so is his very scanty treatment of these same tendencies in Germany. Nevertheless we must agree with his conclusion that, avoiding the errors of both these countries, it would be possible to "make of education in America a great political instrument which shall lay a psychological foundation for a strong national defense and at the same time restrain chanvinism, and pave the way for a realization of the human brotherhood. On the one hand can be inculcated that self-sacrificing devotion to the fatherland which inspires the schools of France and Germany. On the other hand can be de-veloped that true friendship toward other countries which must inevitably precede the complete attainment of international amity.

JAMES G. McDonald.

AMERICAN IDEALS

Edited by Norman Foerster and W. W. Pierson, Jr. Houghton Mifflin Company, 326 pp. Price \$1.25: by mail of the SUR-326 pp. P

ver \$1.55.

This anthology of notable utterances by twenty Americans—supported by five foreigners—on the American conceptions of liberty and union, state and nation, democracy and foreign policy, is meant to clarify our vision of American ideals. As a matter of fact, unaccompanied by notes which would explain their historical occasion or significance, these unrelated speeches, essays and poems only make confusion more confounded. The volume may provide useful material

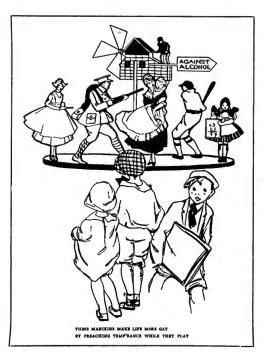

for the preparation of patriotic addresses for those who have little of their own to in point of style, the selection is admirable; but it is not arranged for ready reference and does not stimulate consecutive reading.

COMMUNITY WORK By Frank H. T. Ritchie. The Association Press. 102 pp. Price \$.75; by mail of the SURVEY \$.81.

The author writes after an experience of The author writes after an experience of years as a boys' work secretary in city Y. M. C. A. work, and after nearly ten years with the Boys' Work Department of the International Committee of the Y. M. C. A. He sets forth the need of community work in which the existing agencies of church, school, and municipality shall be used to their full extent, and also sets forth what the Y. M. C. A. community see-

torts what the Y. M. C. A. community sec-retaries have been able to accomplish in a number of places, some having association buildings and some without buildings. The book is full of suggestions on or-ganization and methods, and will be found very helpful to anyone interested in con-ducting work for boys and young men on a community-wide basis.

B. R. F.

THE poster campaign against alcohol of I the Boston Associated Charities has been sending to county fairs an alcohol-education exhibit for children. It is a merry-ge-round of painted manklish, each carrying a jingle. For example, the baseball player as he comes around earries the following:

"No nips for mel" says the great Ty Cobb, "They dim my eye for the batting job."

The soldier says:

"Preparedness means no alcohol. Officers say, 'Don't drink at all For even a little rum or rye Makes it harder to hit the bull's-eye."

The mother with the baby warns against patent medicines. "The reason they make

you feel so frisky, is often because they are who tells of careful experiments showing the made of whiskey," while the little white-capped nurse tells the visitor to the country ment arithmetic. Thus:

"Alcohol opens the door to disease, Tuberculosis, Liver cir-rho-sis! Avoid its use as a medicine, please."

The little fellow at the top, wildly turning a windmill where the wind is kind enough to blow, telis the passing small boy that "Safety first means no alcohol, a drink or two and I might fall."

But the special favorite with the children is the little German girl with the pigtails

'Joss was a gentleman, learned and kind,
'Go to,' he said, 'I will try and find
Whether the children who never take beer
Do sums better with heads more clear.'
So to some he gave little, to others mone,
And what do you think, when the sums were

The scholars who had no beer in their glass Were nine per cent better than the rest of the class."

The merry-go-rounds can be boxed and sent to any child-welfare or health exhibit.

#### ADMINISTERING SEPARA-TION ALLOWANCES

BESIDES its work in France, in the Red Cross home service, and in recreation at the cantonments, organized social service may be facing another big draft on its workers. The war risk insurance act, which went into effect the first of this month, provides only \$100,000 for the expense of administering all its work—insurance, compensation and the \$141,000,000 appropriated for separation allowances for the families of soldiers and sailors.

Much of this work can be done readily from Washington, including the separation allowances for wives and children, which will be paid on easily furnished proof of marriage and paternity. But the allowances for fathers, mothers, brothers, sisters and grandchildren depend upon proof of dependence. Here is where private social agencies may be called upon, for, as Lee K. Frankel, president of the New York State Conference of Charities and Corrections. in session this week at Binghamton, put it, the government appropriation for administration will not suffice to employ visitors for the applications, which may number several hundred thousand in all parts of the country, yet a fair and sympathetic administration of the act demands trained investigators. Without them, abuses similar to those under the present pension law may creep in, Dr. Frankel said. Moreover, any sort of breakdown in the administration is sure to defeat the purpose of the act, which was, "to safeguard and care for the families of those who serve the colors. . . . The free-will expression of duty on the

The free-will expression or duty on the part of an independent people to their protectors and defenders" based on the belief that "no soldier or sailor can do his full duty if he has reason to believe that his near and dear ones at home are improperly provided for."

Such service must be skilled—"the use of the well-meaning tyro in the intricate task of social service is a thing of the past." To cut the knot Dr. Frankel offered the following:

I would, therefore, recommend to the members of this conference who are on the comploy men and women properly trained and qualified to do investigational work in the home, that they offer the services of these men and women to the War Risk Insurance street. This may mean that the societies will be required to continue the salaries of such employes. They will have the satisfaction of knowing that this is their contribution to an efficient administration of knowing that this is their contribution to an efficient administration of knowing that this is their contribution to an efficient administration of knowing that this is their contribution to an efficient administration of knowing that this is their contribution to an efficient administration of the contribution to an efficient administration of the contribution to an efficient administration of the contribution to a deficient administration of the contribution to a deficient administration of the contribution to a deficient administration of the contribution of the contribution to a deficient administration of the contribution o

Dr. Frankel believed that this is the best of all times to survey public charitable institutions, to put in cost-accounting systems, and to de everything possible to introduce economy. But at the best, he believed the social workers of the state will have to back up the institutions in asking increased appropriations of the legislature. As a basis for this he quoted from estimated budgets for the year 1917 submitted to the Federation for the Support of Jewish Philanthropic Institutions of New York city as follows:

Hospitals showed an average estimated increase of 16, per cent, institutions for the increase of 16, per cent, institutions for the care of 12, per cent, day nurseries 60.69 per cent, institutions for the delinquent 7.67 per cent, institutions for the delinquent 7.67 per cent, of the majoryment ageocies 14.71 per cent, bornes for the aged 13.8 per cent, agencies for the education of the handicapped 11.29 per cent, of the contraction of the contraction and contraction and contraction and contraction and per cent and wacation homes 24.12 per cent.

# THE PRESIDENT GOES TO A UNION MEETING

WHEN a president of the United miles from Washington to deliver an address at a union convention, little more is needed to indicate the position of importance occupied by labor. That is what happened last Monday morning, when Woodrow Wilson appeared on the platform at Buffalo, at the opening session of the convention of the American Federation of Labor. Mr. Wilson's discussion of the war and his appeal for continued production served to emphasize the point further. Said the President:

If we are true friends of freedom—our own or anybody else's—we will see that the power of this country and the productivity of this country is raised to its absolute maximum and that absolutely abody is allowed to stand in the way of it.

When I say than nobody ought to be allowed to stand in the way, I don't mean that they shall be prevented by the power of government, but by the power of the American spirit. If we are to do this great thing and show America to be what we believe her to be, the greatest hope and energy in the world, then we must stand together night and day until the job is finished.

Now, to "stand together" means that nobody must interrupt the processes of our energy if the interruption can possibly be avoided without the absolute invasion of freedom. To put it concretely, that means this: Nobody has a right to stop the processes of labor until all the methods of conciliation and settlement have been exhausted, and I might as well say right here that I am not talking to you alone. You sometimes sup the courses of labor, but there are others when the process of the process of the protended of the settlement and the prosent the process of the prosent the process of the prosent the process of the protended the process of the prosent the process of the protended the pro-

At the same time that the President was speaking in Buffalo, the tremendous importance of the workers in connection with winning a war was further indicated by the presence in this country of a special mission of the British Ministry of Munitions, which for several weeks has been visiting various industrial centers, conferring with employers, labor men, government officials and

others on questions connected with the continuous and rapid production of munitions of war.

At a meeting last Monday morning in New York city, under the auspices of the Committee on Women in Industry of the Advisory Commission of the Council of National Defense, members of the visiting delegation discussed the substitution of women for men in British munition factories and some of the problems connected therewith. Other meetings were proceeding at the same time with groups of employers and similar meetings were held last week with organized labor bodies.

One of the points emphasized by the commissioners at all of their New York meetings as elsewhere, was the importance of dealing directly with organized labor. At the luncheon given to the commissioners on their arrival in New York, by the Mayor's Committee on National Defense, Sir Stevenson Kent, the head of the mission, himself a large employer, declared that the success of the Ministry of Munitions was due in large part to the adherence of organized

labor

On Monday, speaking of the substitution of women for men, Commissioner Baillie said: "If we in England had attempted to do this without an agreement with the unions we should have had trouble."

At a meeting with the Central Federated Union the Englishmen were hard put to answer a delegate's question as to what they thought of the failure of the United States to follow England in really taxing excess war profits. They had not come here to advise or criticize America, they said, but one of them ventured to relate that when he first arrived he went to hear a debate in Congress. Congress was talking about taxing war profits. And when he returned to Washington several months later, he again dropped in on Congress-and Congress was still talking about taxing war profits!

A solemn and moving appeal to America to help Europe "rebuild her faith" was made at the luncheon of the mayor's committee by Commissioner Garrod. He spoke of the terrible loss of life because of which "there will lie over Europe for a century a cloud of depres-"In addition to sion and dejection." "In additional these personal losses," he went on,

there is the deeper loss, which I shall call the loss of faith. That this war should have been waged at all; that it should have come as it did, and that it should have been fought with the unspeakable horror and cruelty that have characterized it, has caused the destruction of everything in which men for-merly believed—their faith in justice and freedom and humanity.

The problems of the war are nothing compared to the problems which will come after pared to the problems which will come atter-the war. There are both practical and moral tasks ahead of us, and we shall turn to America for help in meeting them. We have got to rebuild our cities, but also we have

got to rebuild the hearts of men, to re-establish in them the old faith in the ele-mental principles of justice and freedom and bumanity.

#### FINDING OUT WHAT'S IN A SOLDIER'S HEAD

HE psychological examination of men drafted for the new National Army, with a view to giving them "in-telligence ratings," is now going on at four of the cantonments—Camp Devons, Massachusetts, Camp Dix, New Jersey, Camp Lee, Virginia, and Camp Taylor, Kentucky. Never before have examinations of this kind been given to so large a number of adults. It is still too early, of course, to predict what uses the results may have for scienceand for its practical applications to living-but the immediate use to be made of them in the camps and the method of giving them have been described by one of the seven psychologists who, largely through the efforts of the National Committee on Provision for the Feebleminded, came together to work out the method in use. This is W. V. Bingham, of the division of applied psychology, of the Carnegie Institute of Technology, Pittsburgh.

It should be clearly understood, says Mr. Bingham, that there are two distinct uses for the "intelligence ratings" which are given the men as a result of these psychological examinations. One of these uses is military and consists in furnishing commanding officers with a list of the rating of each man in his command by which he may, if he chooses, be guided in selecting men for promotion, or for special duties requiring more than average intelligence and mental The other use is medical, quickness. and is the thing more specifically sought to find men who are so markedly below average intelligence as to demand serious consideration for discharge, or for assignment to work as laborers or to other simple manual work under careful supervision.

Mr. Bingham thus describes the general method of giving the tests:

The men of each company are divided into four groups of 75 to 80 each. Each group is first given a simple literacy test only which of the men can read and write. This is only a preliminary examination, necessary because of the difference in procedure in examining men who can and who can not read and write. The illiterates are withdrawn at this point to be given examina-

All those who can read are then given All tnose who can read are then given he "group-intelligence examination." This takes 40 to 50 minutes. Each recruit is supplied with a pencil and a printed form, but the tasks he is called on to perform do not call for any writing. "Make a mark in the largest square in this row of squares" is one of the simplest of the exercises, which every recruit can do. Successive exercises are more and more difficult, until the last of the first 10 may be something like this: "At the

command 'Go,' cross out the letter just before C and draw a circle around the third letter before K.-Gol"

The next test may be reading aloud by the examiner of sets of figures to test "memory span." After the examiner has read a set of from three to nine figures the men are allowed 10 to 15 seconds in which to write down as much as they can remember of the

Various tests follow: Sentences whose words are not in proper order, arithmetical problems from the very easiest to those that tax the ingenuity without calling for much computation, choosing one of several words which completes a sentence, picking out analogies. etc. Those who did not get good ratings are then re-examined in a group to discover whether they are merely slow or are of low-grade intelligence. They are allowed practically all the time they wish. Any who do not then make a satisfactory showing are grouped with the illiterates, and all these-illiterates and literates who have done well in the examinations-are given tests for manual skill and ingenuity.

After further individual examination those who receive the poorest ratings are likely to be considered for discharge, or as suited only for manual work under supervision. Those who show up par-ticularly well in either mental or manual ability are brought to the notice of their company commanders as men who may be given assignments calling for superior ability.

The aims of the entire psychological examination, says Mr. Bingham,

are to measure native intelligence and abil-ity, not schooling; to disclose what a man can do with his head and hands, not what he has learned from books; and to help the medical officers quickly to discover and sift out the extremely incompetent, and thus pre-vent the inefficiency and injustice resulting from putting men in places which they are not qualified to fill.

#### COPPER AND SHIP STRIKES SETTLED

OLLOWING the success of the President's Labor Commission in adjusting the strike in the Globe-Miami district in Arizona, equal success has been achieved in the Clifton-Morenci-Metcalf district. The production of copper in this district, where 10,000,000 pounds a month is the normal output, has therefore been resumed. Six thousand men were involved in the strike.

As in the Globe district, the commission has provided for the existence and recognition of grievance committees, by whom, with representatives of the company, all future grievances are to be adjusted. One of the features of the strike in this district was a demand to have the wage scale, which has always been lower than in other districts in Arizona. raised to the level prevailing elsewhere. This question was considered too difficult for the commission to settle in the time at its disposal. Accordingly, Hywel Davies, who has frequently acted as a mediator for the Department of Labor, was appointed "administrator," to determine whether "any adjustment of the wage scale is called for, in order to se-cure a fair living wage, having regard to the higher cost of living, to the efficiency or lack of efficiency, and to the financial ability of the companies."

It is provided that if the wage scale fixed upon by the administrator is such as to leave a fair profit to the company, it will at once be "promulgated" by the commission, and go immediately into effect. If, however, it does not allow for a fair profit, the commission will recommend to the President an increased sell-

ing price for copper.

It is evident that the commission intends that this decision shall be final and remove all possibility of future strikes in the copper regions for the duration of the war. One of the paragraphs in the agreement that was accepted in the Globe-Miami district and presumably included in the more recent agreement is the following:

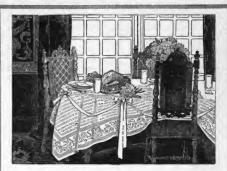

It is understood that this machinery will take the place of strikes or lockouts during the period of the war and no other method for regulating relations between employers and employes shall be substituted except by mutual agreement.

#### THE NEW SCHOOL SPIRIT IN JAPAN

NE country after another is revealing that it is in the throes of an educational upheaval as a result of the general prying and loosening effect of the war. One of the latest is Japan, which is discussing needed reforms in much the same language that western countries are doing. A professor in the Tokio Imperial University, Dr. S. Oshima, has expressed his views in the Japan Magazine, quoted by the East and West News.

Dr. Oshima begins by declaring that Japan has been teaching her children to become good Japanese, but in future "she will have to teach them to be exemplary citizens of the world as well." Greater emphasis must also be laid on thorough scientific training and a more efficient application of scientific knowledge. Two reforms are declared to be already in progress: "The first is an extension of the term for education, the other is the improvement of normal school training."

In primary schools, where the usual term is six years beginning at the age of seven, progress is declared to be less satisfactory than in European and American schools. Defective text-books may be somewhat to blame, but the chief cause Dr. Oshima declares to be the

## Thanksgiving Table Linens

# at McCutcheon's

Beautiful Linen lends an added charm to any table, but never more than when family and friends gather to celebrate the year's great festival of Thanksgiving. For sixty-two years McCutcheon Table Linens have been famous for their beauty and durability.

"Linen" at this store means, now as always, pure Linen, the most reliable in quality and exclusive in design.

Notwithstanding the fact that present-day conditions have greatly increased the difficulty of securing supplies, our stocks will be found equal to the most exacting requirements.

The prices at which they are offered represent real economies for the reason that our purchases were made many months ago when prices were much lower than at present.

This season's designs include many beautiful floral effects, classical Scrolls and Stripes, Indian and other Oriental patterns as well as a multitude of scalloped, hemstitched and embroidered styles from the finest looms of Iraland, Madeira and other world-famed centers of the lines industry.

An early selection is earnestly advised. Stocks of many desirable patterns are limited and cannot be replaced.

If you cannot make a personal visit to our store, write for catalogue. Orders by mail receive our prompt attention.

James McCutcheon & Co.

Fifth Ave. and 34th St.

New York

time required to learn the native ideographs. Young Japanese have to spend years, he says, trying to memorize the characters before they can read textbooks well enough to get any benefit from them.

Normal school education, he says, demands immediate improvement. At present, those who have completed the six years' course at the primary schools may enter the preparatory class at the normal school and, after a year's probation, become regular candidates for the four

years' course. Two factions, says Dr. Oshima, exist among Japanese educators:

One is represented by graduates of the higher normal schools; the other by alumni of the imperial university. It is agreed that the present system of normal training turns the present system of normal training turns out teachers all of whom are too much after the same pattern. Many of these alleged instructors go to their work without any proper sense of the meaning of education. They are interestingless. sense of the meaning of education. I ney are impracticables. Far too little encouragement, or insistence, is given to a liberal course of reading. Teachers who have never been allowed to do anything they were not told to do naturally lack initiative, enterprise and spirit. These characteristics react on the pupil, stunding the natural ability of the rising generation. Further state manufacture and the rising generation for the rising squeration and the state of the rising squeration. Further state of the st

In addition to what has been suggested, there must also be a reform in the subjects taught. Teachers must have more knowledge of the world, of politics and of government. Greater attention must be given to the scientific care of body and mind. Today, teachers in Japanese schools know almost nothing about life and government-they are not allowed to know. As graduates of the higher schools, they have not learned anything about sociology. They are unfitted for conditions that must confront the rising generation. "Japan has al-ready learned that the future of any nation depends on the efficiency of its educators.

# AS TO HOW THE VOTE WAS

THE results of the sufrage and municipal elections in New York were told briefly in the SURWY last week, while in this issue we have some notes from the personal experience of two social workers who took an active part in street-corner speaking. Mrs. Simkhovitch, however, modestly refrains from telling of the campaigning, "close to the ground" as political wisearces put it, which she did in the neighborhood of Greenvich House, and which other settlement residents did throughout Greater New York.

There was, of course, a very thorough canvass of all the men and women of the neighborhood in behalf of suffrage. The district leaders of the political parties, all of whom are well known at the settlement, were frequently met in friendly ways, and it was evident long before election that suffrage had no party opposition in the district—not one of the captains opposed it, and both the Tammany and Socialist men were actively for it.

When the polls opened at six on election morning, Mrs. Simkhovitch was discovered seated on a precarious campstool, wearing a broad, yellow votesfor-women sash. There she saf for eleven mortal hours, fortified from time to time by a fat ham sandwich in one hand, a hard-boiled egg in the other.

Every voter as he came up, she greeted by name. And, as the law prohibits electioneering so near the booths sacred to democracy, she found other means of greeting. "Good morning, Mr. Guglielmo. You see I am here. How is little Angela's sty?"

As a man and a father Mr. Guglielmo was flattered, and as a neighbor he knew that something was expected of him. Here was his friend—the whole neighborhood's best friend—asking of him something which he had and she had not. Mr. Guglielmo walked into the polling place and proudly shared his citizenship.

#### TAKING RELIGION OUT OF POLITICS

LONG-STANDING issue in Massachusetts has been settled, at least for the time, by the passage of the so-called "anti-aid" constitutional amendment which won at the Massachusetts election on November 6 by the large majority of 70,000 votes. It provides that money raised by taxation for the support of public schools shall be spent in public schools only, that is in schools under the supervision of state or town authorities. In addition, no public money shall be used for any college, infirmary, hospital, institution or any educational, charitable or religious undertaking which is not publicly owned and under the exclusive control, order and superintendence of public officers. Public authorities may, however, reimburse private hospitals and institutions for actual care given to sick or dependent persons.

In the form of an "anti-sectarian" amendment, to prevent appropriation of public money for sectarian purposes, this matter has been a legislative issue for some years. In the constitutional convention during the summer and autumn, the question was thoroughly fought out and all interests finally agreed upon the form reported. The committee of twenty-five, including men of many creeds, voted unanimously for it, and in the convention itself the measure received approximately 90 per cent of the vote of both Catholics and Protestants, a remarkable bit of evidence of the conscientiousness and fair-minded-

ness of the work done.

It was feared by some that the broadening of the amendment thus agreed upon by the convention might lead to its defeat because it brought in many interests not originally anticipated. The committee of the convention organized itself for the purpose of pushing through the amendment, and stood its ground before the people as it had before the convention. Although prominent mem-bers of the Catholic church advised support of the bill before the convention. the head of the church in New England came out openly in opposition to the amendment shortly before the election. The bill evidently received a very large Catholic vote, however, and it is the hope of the people of the state that the issue is settled for all time. The Massachusetts tradition and practice is against a system which produces an eternal scramble on the part of private institutions for public money.

#### RE-EDUCATION FOR PEACE AND WAR

HREE promising efforts are being made in Chicago to promote agencies for "reconstructing" men disabled by warfare and others found disqualified for industrial efficiency. Beginning at home with the present wastage of life, the Central Free Dispensary offers to cooperate with the industries of Chicago in saving whatever industrial capacity may be either recovered or developed among the rejected applicants for work. A little money and effort spent in making unfit people fit, will probably save the expenditure of much larger sums in caring for some of these physically impaired people and their dependents through public or private charity.'

The dispensary is asking the employers to refer to it men and women whose applications for work have been rejected. They will be examined and advised at the clinic held by its Department of Industrial Medicine and Surgery. Hospital treatment will be secured if necessary. Every effort will be made to lessen or remove physical handicaps that may yield to either medical or surgical treatment. Thus it is hoped to improve the health and strength of enough of them to conserve a valuable part of the man power of the nation. The problem of the rejected applicant has been nobody's particular concern and such a practical organized effort to bring into cooperation employers, those disqualified for work, and the medical, surgical, and after-care resources of the community, promises to yield valuable economic returns as well as to relieve misery and prevent dependency.

The Red Cross is utilizing the occupational work of the Illinois Society for Mental Hygiene to train teachers for handicraft classes in which disabled soldiers may be re-educated for industrial nursuits.

Those receiving this teacher training agree to devote themselves at least for three months to re-vocational work with men disqualified to resume their former occupations.

Conferences are being held for the promotion of "reconstructional hospital" service on a large scale. The trustees of Wesley Hospital of the the war bepartment for this purpose, and Northwestern University trustees have been approached in the hope of securing the adjoining block as the site of a great vocational training school, if the hospital is taken over by the government.

President James of the University of Illinois urges the purchase of the great baseball park on the west side of Chicago upon which to erect a hospital accommodating 3,000 patients, which at the close of the war might be turned back to the University of Illinois as a teaching hospital connected with the state medical school located not far from the proposed site.

#### THE COMMUNITY BEARINGS OF CHARITY

INDER the presidency of Robert A. Woods, the program of the Massachusetts State Conference of Charities, at New Bedford, was organized about the increasing unity of interest among all sorts of social workers in the community bearings of their problems. Institutional staffs illustrate this with their follow-up work and their growing tendency to point out the conditions which tend to produce the types with which they deal. From this point of view, many branches of service, public and private, were considered over against the background of the state as a whole, representing the full measure of the ground to be covered, the needs to be met, the resources to be drawn upon.

New aspects of the variously organized state-wide services of the public charities, the Associated Charities, the Society for the Prevention of Cruelty to Children and the state institutions in their field work, gave a stirring impression of an informal combination of forces which is reaching out broadly to meet and intercept sources and causes as well as to press curative measures to a conclusion.

#### HOUSING AND OUTPUT OF MUNITIONS

HE committee on housing of the Council of National Defense, only appointed on October 9, already has submitted its main findings to the council. These may briefly be stated to be: that the extent of the present shortage of houses for war contract workers has been exaggerated, and that many communities and individual firms already take care of their own requirements; that the output of some important concerns will be seriously curtailed unless immediate steps are taken to provide additional housing facilities; that aid should be given by the government in the form of loans, at a low rate of interest; that the administration of such loans, though limited to war plants, should be put in the hands of a reasonably permanent department of government.

In illustration of the problem to be faced, the committee refers to a New England manufacturing city where sixteen concerns are engaged upon war contracts, and where accommodation for nearly 10,000 additional men will have to be provided by January 1 if the plants are to run to their full capacity. Another case quoted is that of a great steel company where extensive additions to the plant are nearly completed. It is estimated that here the possible production of guns, gun carriages and other munitions will be curtailed by fully onethird within the next three or four months unless additional houses are built immediately.

"Some loss to the government may reasonably be expected," says the report of the committee, "but the expenditure necessary to give relief is negligible when measured by the loss incident to delay in the execution of the vast war orders already placed."

While its immediate recommendation is for government loans first, the committee also desires the new housing authority to be given broad powers to conduct building operations and to deal in real estate and securities. Above all, it insists that in awarding contracts for war materials, the government shall give due consideration in the future to labor supply and housing conditions, and that contracts shall be distributed geographically as far as possible with a view to preventing undue concentration of workers in any one locality.

The members of the committee are Otto M. Eidlitz, New York, chairman; Gertrude Beeks Easley, chairman of the welfare department of the council; William J. Spencer, secretary, Building Trades Department, A. F. L.; C. G. DuBois, of the American Telephone and Telegraph Company; and Theodore Robinson, vice-president of the Illinois Steel Company.

If you are uncertain where to turn. address the SURVEY, and we shall en-deavor to get your inquiry into the right hands.

#### WARTIME SERVICE

"HOW the Survey can serve" was the subject of an informal conference held early in April, in our library, to which we asked the executives of perhaps twenty national social service organizations. The conference was a unit in feeling that as a link between organized efforts, as a link between organized efforts, as a means for letting people throughout the country know promptly of needs and national programs—how, when and where they can count locally—the SUNVEY was at the threshold of an opportunity for service such as has seldom come to an educational enter-tries. prise.

The development of this directory is The development of this diversery is one of several steps in carrying out this commission. The executives of these organizations will answer ques-tions or offer connect to individuals and local organizations in adjusting their work to emergent wartime demands.

# THE TRUEST BOOK YET WRITTEN ABOUT THE WORLD WAR. THE FIRST ENTIRELY TRUE BOOK EVER WRITTEN ABOUT WAR AS TERRIBLY TRUE AS VERESCHAGIN'S PAINTINGS

# UNDER FIRE

#### by Henri Barbusse

#### Sixth American Edition in Press

Translated from the French (Le Feu) by Fitzwater Wray

The leader of a squad in the French Army tells its story day by day for endless weeks and months as they wait in the second line trenches, are moved forward to the front line, take part in the fighting, wallow in the mud, shiver and freeze, are wounded or killed. The life of this squad is the life of all the millions of men engaged in the World War. and

#### It is All There With All the Monstrous and Horrible

details that other writers have skimped or disinfected or ignored. Henri Barbusse does not merely write about war. He takes you with him and makes you live it yourself. An English author complaining in a London journel' i'll our war correspondence war is left out" and that "not a tithe of the truth about it has been told," says of "Under Fire": "This book is a spitting out of the mud of convention, of false phrases, of cast, of lying rhetoric—all the putrescent literature of war. It is mankind itself Sloughing its Ewil Skin of Illusion."

"This novel is epic in proportions," says The New Republic. "It reduces Mr. Britling's Intellectual Reactions to insignificance."

to insignificance.

"Under Fire" filis you with shame that you have any cover save that which a mud wall opposes to an aching body. It makes you realize that the common man is the hero of this cataclysm and that from it democracy and cantonment and attack with a humanity so passionate and a sincer, an observation so keen and so humorous that the stark brutality of his realism is transfused with a sort of sombre poetry, even a sort of brilliance—Gradually you realize that an unbearable amount of life is ebbing from the world. Death may lurk long, but strikes at last, and to face him unfinchingly in the monotonous discomfort, in the superhuman fatigue, in the infamous filth of the trench requires of a rolder with a civilian's heart a

#### Spiritual Effort Whose Magnitude The Untried Civilian Can Never Really Grasp.

In a long review in Pearson's Magazine Frank Harris says: "At last we have an authoritative message from the French trenches, the bare, unvarished truth. It is a revelation, the truth told simply with soul-shattering effect."

The Nation calls "Under Fire" the greatest of the books that Voice the new Spirit of France and pronounces it the strongest and grimmest book yet written

about war.

The New York Evening Post says that to get the full truth about the war we have to wait for a writer, with the courage and the imagination of M. Barbusse, who it declares has painted the common soldier's Unglamorous World with Masterly Fidelity, and has represented the most terrible ordeal human beings can undergo and survive.

dergo and survive.

The New York World says that its chapters are "continuous pictures," and The New York Times that it gives "An unforgettable impression." Writing in The Bookman, Frank Moore Colby says: "There is much more than the life of the survival of the survival

Says The London Observer: "Some unknown man of genius who calls himself Fitzwater Wray has translated The Supreme Novel of the War, and here it is in its divine sublimity of truth, undraped and unbedirened. I do not hesiate to put it on the shelf beside Urquhart's 'Rabelasi' or Fitzgerald's 'Omar' for it is in my mind already a classic. . . The idyll of Paradis and the boots; the 'triple tragedy of Lamuse, Farfadet and the lair-headed Eudorie; the pathetic tenderness of the little pictures of the dying dog; the whimsical humor of The Egg. the grey sorrow of the chapter to Souchez; the heartbreaking story of the husband who went on leave; and a dozen more—the Rich Variety of the Book is Indeserbable.

"The most wonderful chapter of all is the description of the bombardment. Many men have tried to describe it, but this chapter is the thing itself, seen and heard as if you were in it. And yet the description of the attack is still more terrible. One grows sick and dizzy with horror as one forces one's way through the organic details of the stumbling, staggering charge. If any Book Could Kill War, This Is that Book."

Not only is this the greatest and truest, the most mercilessly truthful book that has been written about the state of the true of the state of the s

The books France more there who real Goncourt Prize (or the best work published in France last year. It has sold in and an American lately returned from that country says that literally everyone talking about it.

#### THE DEAF MUTE

By Florence Ripley Mastin

[Through an error, for which hearty apologies are tendered, Miss Massin's werses, The Deaf Mule, were published in last week's issue of the Sunvey in manufed form. We hatten to repeat them herewith as written!

HE walks within the dim, blue dusk When shadows floor the beach. He's deaf and strange of speech.

The sea is in his gazing eyes, Dark shadowed, gray and sweet; He walks alone beneath wide skies With silent feet.

Against the sunset cloud he stands Upon the lonely dunes. His caged soul flutters down the sands Where the grey sea croons.

In some blue dusk for him will fall An hour; unknown to men His ear will catch the sea's deep call. How sweet his singing then!

# Four Months in France

An Interpretation of the American Red Cross I. Here to Work

> By Paul U. Kellogg EDITOR OF THE SURVEY

Paris, October 15. HE work of the American Red Cross on the entire western front centers at Paris under a commissioner to Europe. It began June 12, 1917, when the commissioner and a group of deputy commissioners landed in France, each assigned on shipboard to some piece of investigation for which he was equipped: existing war relief, the building situation, sources of timber in Switzerland, medical service, the methods of the British and French Red Cross organizations in serving their troops and so on.

From the outset it has been an operating organization. The purpose was not to investigate and report back, but to set to work. It was not an expeditionary force, committed to a single object and organized before coming to effect that object; it was a great business of service called on to project among a friendly people the instruments through which the funds raised in the United States, mounting up over \$100,000,000, could be brought to bear wherever and in whatever ways they would count for most. Money, energy, credit, materials, America had to give, but above all, organizers of the type who have built up our industries, transportation and social work.

operations has been laid down. The organization has been kept flexible. With one notable exception, no man is today at the head of a department who was in France when the commission reached here. One after another the underlying needs of the situation have been uncovered and the responsibility for helping meet them lodged in the hands of trained men from the states. At the same time existing activities have been taken over and enlarged to meet the enlarged demands upon them. In this respect the work has been like rebuilding a railway terminal while keeping the trains running. In more ways than one the comparison holds, for the whole service may be conceived as a distributing terminal for the organized practical help of America.

At the end of six months, or by January 12, a permanent

At the end of four months the framework of Red Cross a month. These are merely outstanding items in a service schemed

line-up of the executive force will be reached with perhaps 1,000 people at work. A string of warehouses will extend (along the front) from Dunkirk to Dijon, with reserve warehouses back of them and in the devastated areas; floating warehouses in Belgium, ready for any advance in the lowlands; great storage centers in Paris; Red Cross receiving houses at all ports of entry, and purchase and supply stations wherever possible in Great Britain, Switzerland, France, Spain and Portugal as well as America. The war-relief warehouse capacity in Paris has been increased from 50,000 cubic feet to 5,000,000 since the American Red Cross has taken hold. In purchasing, the increase in bulk has been nearer 1,000 than 100 per cent and is now based on budget estimates drawn up for six months in advance and running into such items as complete sawmill units, portable engines and gasoline tractors, 50,000 yards of flannel, 150,000 pairs of sheets, 1,000,000 rolls of absorbent cotton.

The distribution of hospital supplies has been coordinated in a single agency, reaching 3,617 hospitals in 1,356 towns, the available funds for which are more than doubled; and more than doubled also is the work of supplying surgical dressings, which reaches 1,729 hospitals monthly. Both continue in the hands of the efficient managements which pioneered them, but both have become services of the Red Cross. Plants for the manufacture of special medical supplies, bureaus for the exchange of surgical methods, and huge reserves to stand back of the medical department of the American army are being built up by the Military Affairs Department, which also is opening the first stations of a canteen system that eventually will reach 1,500,000 French soldiers

for effective delivery of output at any point behind the French. Belgian or American fronts, through a transportation department with 500 cars in commission and 400 ordered, with permanent equipment located at twelve centers outside Paris, and committed to a policy of moving all supplies as rapidly as practicable from ports of entry to as near as possible the The Survey, November 24, 1917, Folume 39, No. 8. 112 East 19 street, New York city points of ultimate consumption. Placement and movement of this equipment is visualized at transportation headquarters in the old clearing house building at 5 rue François Premier on a wall map which, as one of the transportation men expressed it "reaches the ceiling of the tallest r.oom in Paris."

#### Sharing Stress

THE development outlined, not without its full share of setbacks and inadequacies, has been pushed forward against physical odds, which have put American resourcefulness to the stiffest sort of test. And at that there remains to be set down, paralleling the work for French and American soldiers, the development of an equally far flung work for French civilians. For the duties of the American Red Cross in France are three:

Its first duty is to serve the army of the United States.

Its second duty is to serve the sick and wounded of the allied armies.

Its third duty is to give such general assistance as it can to the French people.

In the present crisis, these three duties are close of kin. The primary purpose of the men who reorganized the American Red Cross on a war footing, formed its war council, raised its hundred million dollar fund, and sent the commission to France, was to help win the war. With them are associated others whose concern is the historic humanitarian task of easing the suffering of the sick and wounded; still others, with the far-sighted social purpose of conserving for the future, out of the wreckage of war, the human resources of France.

All three motives may fire the vision of the same man or put urgency into a given branch of the work. Thus the relief work is conceived by the Red Cross administration to be of immediate importance to the conduct of the war. It eases the distress of the civilian population which has suffered terribly, and will help make the French people at large feel that we are doing our part even though Americans may not be in the trenches this fall and winter. The United States cannot expect to take any substantial share in the field until next spring. Nothing, it is held, will count for more in maintaining the morale of the French people in the interval than the energetic carrying forward of the Red Cross program.

For not only has France been holding two-thirds of the western front and maintaining the large industrial and transportation operations which serve its army in the field, but in addition France has been caring for the heaviest of all back-set currents of wounded, sick and crippled men and their families; caring, also, for an estimated total of 1,500,000 refugies from the war zone-roughly one-thirtieth of the population before the war-many of them without homes, with fields devastated, and with no source of livelihood other than government grants. This total is constantly fed by a current of repatriated folk entering France through Switzerland at the rate of 1,000 or more a day. These réfugiés have gathered largely in the cities, where many live in crowded and unsanitary surroundings. Moreover, as Dr. Osler expressed it, the tubercle bacillus enlists with the soldier and France, which has always had a heavy mortality from tuberculosis, is threatened with a national health problem of unexampled proportions; while with the proverbially low birthrate further cut down by the war and the infant death-rate undoubtedly increased, the future of the republic is bound up in conserving its children while the war goes on.

By means of hospitals, relief societies and specialized institutions, American no less than British help made itself felt during the period of our neutrality. But through it all, the heavy end of the load no less than the burden of maintaining the great span of the front, has been carried by France despite the fact that some of its richest towns and producing districts are in the hands of the invaders. If there is one impression more than another borne in upon the American Red Cross staff, it is the spirited resourcefulness and high courage of the French people in bending, but never breaking beneath the strain.

In such a situation great loans made by the United States government to the French government appeal to the banker and business man. Military engineering projects appeal to the army staff. But neither reaches home to the men in the street or in the ranks. If the Red Cross canteens serve hundreds of thousands a month at junction points-the soldiers on leave, or permission as the French say; if its first-aid kits and its tons of gauze and hospital equipment help carry conviction that succor will always be at hand for the wounded (by always being at hand); if its grants help make sure that the families of French soldiers will not suffer intolerably for coal and food this winter, then the French people will have concrete evidence that America is "on the job." They will have it, also, if the Red Cross bring its resources to bear so that medical care can be given promptly to réfugies, so that they can be more comfortably housed, so that more of them can get back to their homes, and so that distress and disaffection among the fugitives congested in the cities will not become points of national weakness.

All this will tax the resources of the American Red Cross -not only the money already in hand, but still larger funds will be needed-in a way which can be compared only to the work of the Commission for Relief in Belgium. But with this difference: Here in France there is not only need for a tremendous work of relief, but opportunity for an even greater work of rehabilitation. Here the American Red Cross is engaging in laving foundations which may stand for generations. It has enlisted some of the most experienced leadership in constructive social work and is backing it up with absolute loyalty and confidence. Its ability to secure transportation, supplies, machinery and labor is being put at the service of relief and rehabilitation in the war zone. It has divided the belt of devastation into six districts, has assigned to each an American delegate and is aiding French and American agencies to help bring in the beginnings of normal social life and look after the children, the aged and the sick left behind when the Germans retreated. In cooperation with the French government and the Society of Friends, it is starting building repairs in the best wheat regions of the liberated district (giving them precedence for the sake of food production next year). For the service of France as a whole. it is putting itself unstintingly into unexampled health movements designed to outflank the two great assaults by disease on the nation's vitality. It is cooperating in a tuberculosis campaign which, if plans carry, should bring about in four years as great an advance as the most progressive American state has achieved in ten, and a child welfare program to match it.

#### Making Social History

ALONG with this long range planning which is making social history, has gone quick, sure-footed help in emergencies. An early example was the children's shelter established on July 27 at Toul in the war zone. Gas abombs were being used by the German forces and the inhabitants of the nearby villages were obliged to wear masks to escape asphyxiation. Word came from the prifet of the department that 350 children too

young to be trusted to keep their gas masks on had been thrust upon his hands and that he needed immediate assistance. The next day eight workers left Red Cross headquarters—a doctor, an experienced nurse, two auxiliary nurses, a bacteriologist, an administrative director and two women to take charge of bedding, clothing, food.

The children, all of them under eight years of age and twenty-one of them babies of less than one year, were found herded together in an old military barracks, dirty, practically unfurnished, and without sanitary appliances. Sick children were crowded in with the well and skin diseases and vermin abounded. Within two days the children had been thoroughly cleansed and transferred to a new and clean barracks; medical care had been given, wet nurses secured for the babies, suitable food provided, and a classification of all réfugies made to prevent the separation of members of the same family. Thereafter, on invitation of the French authorities, specialists in children's diseases made an examination of other children's asylums in this department with the idea of improving their medical and sanitary work, and also examined several hundred additional children from Pompey, Fouard and towns nearby, who had been romoved from the cellars where the families had taken refuge from recurring bomb attacks.

#### Ready When the Call Comes

ON SEPTEMBER 5, in the presence of the préfet of the department, two generals of the French army, the senator of the department and several American doctors and nurses, the French and American flags were raised in front of the new barracks, now the Red Cross infirmary, which has since been augmented by a children's hospital equipped by the American Fund for French Wounded. This has become the center of the American Red Cross child welfare work for the entire department of Meurthee-t-Moselle, and the whole series of undertakings illustrates how far a prompt response to an opportunity for help can be made to reach. Just that has been the general working principle of the American Red Cross in its four months in France—to come forward with definite things rather than vague assurances in approaching the French people, shouldering as it is the greatest stress ever put upon a modern nation.

Finally, to understand the program entered upon by the American Red Cross and its relation to other agencies, it is necessary to bear in mind the sweeping changes brought about by America's entry into the war. The United States was no longer a neutral but a combatant, deploying its medical service along with its troops. The Army Medical Department took over various American hospitals as units and established others which, pending American easualties, are serving the allies. To help our troops was the especial patriotic obligation of the Red Cross. In addition, such assistance as America could render the French medical corps, in the Service de Santé, and such help as it could muster in building up forces of resistance among the French civilian population, were no longer conceived merely as humanitarian projects but, as we have seen, as responsibilities bound up in our national purpose. They were beyond the resources of existing American agencies and altogether too serious to leave at loose ends. Moreover, the demand on cargo space for transporting military supplies made it necessary to conserve every ounce of tonnage available for medical supplies or relief shipments, cut out all waste and route all materials where they would meet the greatest need and in the order in which they would be needed most.

Moreover, the American Red Cross, arriving in France, was confronted by a series of underlying problems which since the beginning of the war French governmental and private efforts had been doing their best to solve. These necessities had resulted in laws passed by parliament, réglementations established by the various ministries, the institution of a number of new departments and committees and the opening of large credits to help remedy the misery of war. But whatever may be the governmental or private undertakings, those miseries are far above any remedy so far offered. In any country at war, the national military necessities come first and there remains much for a great fratenity in philanthropic endeavor.

All this called for building up an efficient Red Cross organization in France, but it called also for cooperative relations at every point with the American expeditionary force; with the French government (from the national administration to the army group commanders and the sour-prifets); with American Red Cross activities in Great Britain, Belgium, Italy and Serbia; with the Rockefeller Foundation in initiating its permanent tuberculosis work in France; with the Y. M. C. A. in its war-time recreation program for the French and American armies, and with French and American private seencies in general.

The commissioner to Europe is a member of the War Council of the American Red Cross and, through the gift of the French government is in free cable communication with Washington. He is a member of General Pershing's staff, with a representative constantly at United States army headquarters. A department for Belgium has been created with headquarters at Havre. Initial negotiations with the French government are carried on through the Ministry of Foreign Affairs, and this work is in the hands of the director-general of the Red Cross. Inasmuch as the organization is brought into intimate association with the various departments of government. liaisons have been established with each group of armies, with general headquarters, with Marechal Joffre, with the military governor of Paris, and with the Service de Santé. The director of the Department of Civil Affairs is a member of the Rockefeller Commission for Prevention of Tuberculosis and the medical representative of that commission is consultant of the Red Cross department.

#### French Charities Decentralized

RELATIONS with existing voluntary organizations have presented a more complex problem. For although government in France is centralized far beyond anything we know in America (préfets and sous-préfets of the departments being appointed officers and only the local maires elected), private benevolence is decentralized and individualistic. Even the work analogous to that of the American Red Cross has been in the hands of three organizations which only since the present war have been associated in a common committee. The characteristic development is that of oeuwres, or literally "works," and while not a few of these are strong, efficient and national in scope, many are local, devoted to some single project and so fragile that the charities' directories are soon out of date.

This system was very naturally reflected in the organization of a great company of American war charities, some feeble and transient, some resourceful and with a history of devoted service dating back to the early months of the war. Movements among them to secure a united front, to prevent overlapping and systematically to cover the field, had all failed prior to America's entry into the war. So had efforts to this end set in motion by the French government, which had put an open space, part of the old fortifications close to the Porte Dauphine, at the disposal of the foreign societies and had erected

a series of barracks for their use, a veritable little village laid out on town-planning lines. Four organizations had, however, developed schemes of common service: the American Clearing House, which handled shipments from America to all war-relief agencies in France and was the French representative of the American Red Cross; the American Fund for French Wounded, the National Surgical Dressings Committee of America, and the American Distribution Service. These agencies were supplying institutions running up into the thousands. Immediately on the arrival of the Red Cross commission, the American Clearing House placed its entire staff and organization at its disposal, its director-general, H. O. Beatty, carrying into the new organization invaluable experience and acquaintance and breaking the ground for the new era of relationships. As steps in coordination, the war relief, medical supplies, and hospital dressings services became organic parts of the new Red Cross; working alliances have been effected with the American Fund for French Wounded and other agencies; a Women's War Relief Corps has been organized to afford an adequate channel for cooperation by American women in France, and the Red Cross itself as an operating organization has been built up into three main departments: military affairs, civil affairs and administration.

What follows is in no sense an official statement; still less it a critical review either of policies or of performance to date. Rather it is a mosaic drawn from reports and interview—an attempt to set down affirmatively the field of work—as the men in charge see it and the things they are driving at, and to set both down more often than not, in their own words. Nothing will better serve this process of interpretation, let Americans catch a glimpse of the opportunity before the Red Cross as seen through French eyes and at the same time translate something of its spirit and outlook to French readers, than to quote a French engineer of distinction, L. Chevrillon,

long a member of the Belgian Relief Commission and now associated with an important Red Cross bureau;

Above all, the work of the American Red Cross should intensify the natural current of sympath which exists between France and America; encourage exchanges of views; study French methods; offer to France certain examples of American methods and bring to this suffering country, which has been fighting for three years, the moral support of American national solicitors.

It should be an institution not conducted merely from the point of view of intelligent relief or of proper management, but it should be also a great work of inter-penetration of the two nationalities.

It should work to develop points of contact; to dissipate all mis understandings and attenuate the differences in point of view in this respect, the work of the American Red Croas is perhaps as important to the United States as it is to France, for it assumes the sate of awakening the American public spirit to the exact shade of sentiment which will arouse a device to help without in any way diminiing the prentige obtained by France in America by this long period of serifice.

It will accomplish its work fully if it succeeds in bringing into light in France American initiative, the American genius for organization and invention and the ardent spirit with which all the Red Cross volunteers have thrown themselves into this work for love of a cause, which is that of France.

The program of the Red Cross has been conceived in accordance with the above suggestions. It will endeavor to create inimisate contacts and to establish work in common between its various departments and the French institutions organized to provide for the same needs. It will do its best to improve existing methods and it will create vast fields of experiment for the application of new methods.

Taking into account the fact that France has had to sacrifice to military necessities and has had therefore to give secondary consideration to the relief of war sufferings, it will help with its capital, in mee, its personnel, with the ability of its technical advisers and with the work of all its staff, all those institutions which have not universal drama which has brought them into being. It will hasten the solution of certain problems which appear to the French minds as still far distant. It will suby itself with the needs of orphans, children, the tuberculous, rejugits, repatries. It will study the great problems of after-the-wars, such as depopulation, rehabilitation of will do its best to prepare a thorough and rapid remainstance of still the vital forces of the country.

# Erasing the Color Line

The Supreme Court Decision on Negro Segregation

By William H. Baldwin, 3d

HE United States Supreme Court, in declaring unconstitutional the residential segregation ordinance of Louisville, Ky., has made void similar ordinances in Richmond, Baltimore and St. Louis, and has put to an end agitation in many other cities which has looked toward the same specious "solution" of the urban Negro problem. At the same time, the decision has heartened Negroes throughout the country, as it is a reaffirmation of the fact that the colored citizen is on a par with his white neighbor in the eyes of the fundamental law of the land even if prejudice at times and in places rises to gall his feelings and to make him the victim of gross injustices. Whether the decision is a long step toward the day when the conception of public rights will no longer be restricted by the plausible qualification of furnishing equal accommodations and privileges, it is not for a layman to predict. Yet it does seem logical that if a Negro is now sustained in his right to buy, sell and use property-and therefore to reside-where he will, he ought also to have full right to choose his own seat in a public conveyance. Then would end the overcrowded, filthy Jim Crow car with empty white coaches behind, and with Iim Crowism would end one of the greatest indictments against the South's treatment of the Negro. What that would mean must be considered in the light of the new sense of value which has come to every individual as the result of war production, economy and financing, and which is accentuated in the Negro by reason of the great emigration from the South.

But that is all speculation. The recent decision of the Supreme Court is a distinct end in itself. The title of the ordinance in question is: "An ordinance to prevent conflict and ill-feeling between the white and colored races in the city of Louisville, and to preserve the public peace and promote the general welfare by making reasonable provisions requiring as far as practicable, the use of separate blocks for residences, places of abode and places of assembly by white and colored people respectively." By its provisions it was made an offense for a person of color to move into a house on any block where the majority of the houses are the homes of whites, and, conversely, the same restrictions were placed on the movements of white residents.

"This drastic measure," says Mr. Justice Day, who wrote the opinion, "is sought to be justified under the authority of the state in the exercise of the police power. It is said such legislation tends to promote public peace by preventing racial conflicts; that it needs to maintain racial purity; that it prevents the deterioration of property owned and occupied by white people, which deterioration, it is contended, is sure to follow the occupancy of adjacent premises by persons of color." Justice Day points out that "in the slaughter house cases [the first to come to the Supreme Court under the fourteenth amendment] it was recognized that the chief inducement to the passage of the amendment was the desire to extend federal protection to the recently emancipated race from uniriendly and discriminating legislation by the states." To this retieration of an earlier decision the justice adds the following words, which undoubtedly will be quoted by future terms of the court in rendering yet more progressive opinions:

"That there exists a serious and difficult problem arising from a feeling of race hostility which the law is powerless to control, and to which it must give a measure of consideration, may be freely admitted. But its solution cannot be promoted by depriving citizens of their constitutional rights and priviierce."

In other words municipalities are given notice that whereas they can experiment with zoning systems to prevent encroachment of certain kinds of business upon residential sections, they will have to find other methods of solving racial problems. And the decision comes at a time when several northern insurial centers are becoming restive under the great influx of Negroes from the South; for residential segregation seems on easy way of meeting the situation. In making such a quack curveall illegal, the decision will bring cities North and South eventually to realize that the problem and its solution lie deep in a healthy spirit which sees all urban problems to community problems and which seeks their solution through the cooperation of the best elements, both black and white.

In more than a score of cities this work is already being ecomplished by committees of white and colored men and women, which are affiliated with the National League on Urban Conditions among Negroes. The program is to educate city officials and social welfare organizations into working for the whole city without regard to color and one of the most important phases is seeing that the standards of sanitation, housing and police protection are not allowed to sag, where colored residents are involved. When they do sag, and sag they inevitably do wherever the Negro is confined to certain districts by law or strong popular feeling, the result is a distinct lowering of the health, morality and order of the whole city; for only the most fanatical Negrophobe has any dead of advocating segregation in the fields of business and in-

dustry and especially of domestic service. As for the argument of racial purity, advanced by the defenders of the segregation ordinance, it is uncontrovertible that miscegenation is directly inverse to the jealousy with which the whole community protects the good name of colored women.

There remains then only the personal antipathy of most white people to living in close proximity to Negroes, with the subsidiary consideration of unsettlement of property values. Anyone who expects an immediate inundation of his residential section by hordes of Negroes as the result of the Supreme Court's decision forgets, first, that the great bulk of colored people is among the poorer classes in the United States and, second, that those Negroes who command the necessary wealth to live comfortably are just as proud as the proudest white, and have no intention of forcing themselves in where they are not wanted. What they do seek is to live in as decent surroundings as their incomes permit, and not be forced to live with the lowest members of their race in some district which the white authorities condemn through utter indifference to reek in neglected filth. With segregation in fact or as a threat no longer available, the best thing a city can do if it is set on keeping the races apart is to see to it that the Negro sections are kept clean, well-ordered and attractive places in which to live.

A word should be said in closing as to the fine work which the National Association for the Advancement of Colored People has done in obtaining a favorable decision in the Louisville case. The Journal and Guide, a Negro newspaper published in Norfolk, Va., says: "We are hopeful and optimistic. The segregation decision of 1917 is a far step from the Dred Scott decision of 1857. And it must be remembered that the decision was handed down by a Supreme Court the majority of whose members are Democrats, and whose chief justice is a native southerner. The decision is unique and remarkable also for the reason that never before in the history of the Supreme Court has that tribunal reached a unanimous decision upon any question upholding the rights of the Negro." It is indeed a case of which the National Advancement Association and its branches in the four cities which had passed segregation ordinances, may well be proud; and all who have the interests of the colored people at heart. and who are working for intelligence in the solution of municipal problems owe a debt of gratitude to the association and to its president, Moorfield Storey, of Boston, who served as chief counsel before the Supreme Court.

# Sing Sing's Swan Song

By Winthrop D. Lane

EW more dramatic scenes have been enacted in any prison in this country than that which occurred at Sing Sing November 9, when Governor Whitman amid the cheers of assembled law-breakers, lowered the first stone to be removed from the bastille cell-block at that institution in the process of demolition which the last legislature enjoined.

Sing Sing is actually to give way to a new, sanitary, industrial prison on wide acreage in the country. This has been the object of an energetic campaign in New York state for afteen years.

The stone had been pried loose earlier in the day by

prisoners themselves. Prisoners, too, hung with a will on the rope on which the governor put his weight to keep the stone from falling. It was clear that no law-breaker in Sing Sing felt sorry to see his house pulled down about his ears. To the prisoners, as well as to onlookers from the outside, the stone was the symbol of an outworn philosophy and treatment of hunan beings. With it, said one speaker, went "all the anguish, tears, disappointment and lost opportunity of reformation" that Sing Sing has stood for throughout most of its innety-odd years of existence. Its lowering, said James M. Carter, superintendent of state prisons, was a bit of "unagible, evident, concrete prison reform" and

George W. Wickersham, former attorney-general of the United States, added that it meant not only "the beginning of a new building, but of a new thought and a new tolerance as well."

In the destruction of the building stone by stone, State's Architect Lewis F. Pilcher, who drew the plans for the receiving and distributing station that is to replace Sing Sing, saw a counterpart of the individualized treatment of prisoners that is coming to be accepted by penologists todaythe study of each law-breaker's characteristics, heredity and causes of delinquency, and the effort to give him the advantage of remedies fitted to remove those causes.

Henry M. Sage, state senator, who with Assemblyman Adler led the fight for the destruction of Sing Sing in the legislature, reminded his hearers that there was another prison in the state with a cell-block, as much in need of destruction as Sing Sing, namely, Clinton prison at Dannemora. Here not only is the architecture ancient, but the administration is much in need of the enlightening touches that have come to Sing Sing in recent years,

Only a few days later a revolution of a different sort occurred at a state prison of the cell-block type in another state. where the light of publicity has recently been let in upon the treatment of men behind the bars. This is the New Jersey state prison at Trenton. For the first time in its history prisoners were allowed the freedom of the prison yard. For two hours and half they ran, played "three o' cat," wrestled and discussed the new order of things in groups. Additional grounds are being prepared across the street, and these will afford ampler facilities for recreation in the open air. An improved system of grading inmates is to be adopted also, so that men can earn certain privileges heretofore denied them. Both these reforms have long ago been adopted by enlightened prison administrations, but New Jersey is not the only state that has lagged.

The cell-block at Sing Sing, built in 1825-30, was designed to fit the following idea of prison punishment, as reported by a contemporaneous committee of the state senate:

"To make any impression upon the minds of either convicts or the public, there must be suffering (on the part of the inmates); and to make any adequate impression, such sufferings as will excite feelings of terror."

The cells at Sing Sing are 3 feet 3 inches wide, 6 feet 7 inches high, and 7 feet long. They afford 148 cubic feet of air space, less than one-third of the amount the law requires for a single lodger on the Bowery. Prior to Mr. Osborne's wardenship, the men spent 111 of the 168 hours of each week in these cells. The cell block has been a prolific cause of tuberculosis, rheumatism and other diseases, sending men forth into society much less fit for physical work than when they went in.

The prison that is to replace Sing Sing is to be built at Wingdale, in Dutchess county. It is to be a farm industrial prison, composed of groups of detached or semi-detached small buildings. The Sage bill appropriated \$1,250,000 for the erection of this prison. Its construction is in the hands of the Commission on New Prisons and excavation has already begun.

Meanwhile, the present Sing Sing site is to be utilized in a novel manner. Representing an investment of approximately \$1,000,000, it will not be abandoned entirely but by the addition of new buildings on the high plateau east of the present structure, and up from the Hudson River (land which has not heretofore been used for prison purposes), it will be made into a receiving and distributing station for all prisoners sentenced to state prisons. Here law-breakers will remain

for from three to six months. During this time they will be classified on the basis of their mental characteristics, physical ailments or abnormalities and the kind of treatment best suited to them. They will then be transferred to that one of the four state prisons where they can receive the closes: approximation to the needed treatment. There is not among the state prisons today any systematic classification of inmates First-timers and others are sent to each. Those seriously il. with tuberculosis are sent to the special hospital at Clintor. Prison, but in general there is not even an approximate class: fication.

Accommodations for 1,000 prisoners will be provided a this station. The lay-out is such as to afford a relatively nor mal form of daily life. The erection of the buildings by inmate labor has already begun.

In this connection it is interesting to note a proposal for a possible redistribution of the inmates of both state prison: and reformatories made by the Prison Association of New York in its latest annual report. This has value both for New York and other states also. The proposal begins by distinguishing the following five principal classes of prisoners requiring individual treatment: Feebleminded, requiring segregation (estimated to be approximately 10 per cent of the total state prison and state reformatory population); psychotics (approximately 2 per cent); perverts (1.56 per cent); tubercular (10 per cent); cardiacs (3 per cent). When these classes have been segregated, the remainder, it is believed will constitute the reasonably normal-those who, for example, could be expected to profit most from self-government.

The association presents three plans for redistributing the present population on the basis of this classification. The first of these merely contemplates a shifting of inmates from one state prison to another, or from one part of one prison to another part, in the interests of better classification, and could be carried out by executive order without new legislation. The second contemplates converting the branch of the state reformatory at Naponoch into a special institution for defective delinquents, both those found in the state prisons and those in the two state reformatories. This would diminish the housing capacity of the reformatories. The plan proposes to counterbalance this by removing the tubercular and the perverts as well as the feebleminded from the main reformatory at Elmira and putting them in specially selected parts of the state prisons.

The third plan provides temporarily for a more reasonable treatment of male misdemeanants of reformatory age now held in county penitentiaries outside New York city and combines the whole matter of their disposition with the plans worked out above for the state prisons and reformatories. At the time of the study, about 900 male misdemeanants between eighteen and thirty years of age were held in the four county penitentiaries considered. The plan proposes that these mer. be sent hereafter directly to Elmira Reformatory on indeterminate sentences with a suggested maximum of three years: they can there receive treatment much more likely to send them forth well and useful citizens than the county prisons afford. The plan assumes that the changes contemplated by the second proposal, outlined above, shall have been adopted Ultimately, under this plan, modern smaller units could be built at Elmira reformatory to provide for an increasing pop-

These proposals have been submitted to the public by the Prison Association for discussion, and are predicated upon the use of Sing Sing as a receiving and distribution station only, which as we have seen, is now in process of accomplishment.

# HOME SERVICE

# The WORK of the AMERICAN RED CROSS in the UNITED STATES

By W. Frank Persons

DIRECTOR GENERAL CIVILIAN RELIEF

OME Service is that phase of the work of the Department of Civilian Relief of the American Red Cross which is concerned with the welfare of the families of men enlisted in the armed service of this country and of the families, resident in the United States, of men serving with any of its allies. It is distinctively organized and is not to be confused with "disaster relief," which is another responsibility of the same department.

Home Service is essentially not "relief" in the sense of money payments or doles of food or clothing, though such assistance may on occasion be needed even by the families of soldiers and sailors. The enactment of the war risk insurance law, heartily advocated by the Rod Cross, has placed the responsibility for such help, in large measure, where it justly belongs.

The Red Cross, as representing the intense interest and desire of the American people, has undertaken the duty and the privilege of doing for the families of soldiers and sailors what the government cannot do. Hundreds of Home Service workers in every part of the country, who are now in daily contact with such families, know that it is a present fact and not a mere theory which confronts them and that many of the family situations encountered demand a friendly and individualized attention which the government cannot give. And yet it must, so far as is humanly possible, be assured that when at last our country's soldiers and sailors return home their families shall be found to have maintained the essential standards of home life. Nothing less than this will measure up to American ideals. On American ideals the duty and the opportunity of Home Service are founded.

#### OPPORTUNITIES OF HOME SERVICE

THE greatest opportunity of Home Service is the conservation of human resources—their conservation, that is, in families left behind by men at the front or on the high seas. A majority of these families will be able to maintain good standards of health, education, industry and family solidarity without relying upon outside service of any kind. But in a large minority, on the other hand, these powers of self-helpfulness will be strained to the breaking point by lack of opportunity, by ill health, or by the sudden changes in way of living due directly to war times.

The second opportunity for which the government, in the very nature of things, cannot make provision, is relief in emergencies—the opportunity to meet, for example, temporary need of money help while legal claims are being adjusted or while the receipt of an allowance is delayed. This probably is not going to be a heavy burden, but it is one in which promptness is all important and one for which Red Cross Home Service was responsible without federal aid during the first seven months of the war, when there were no family allowances. As the government assumes its rightful respon-

sibility on the financial side, Home Service sections will be careful to continue their relations of confidence and friendship with families previously aided and to conserve the welfare of these families in every possible way.

The third opportunity, like the first, will be not only a continuing but an increasing one. It involves regular allow-ances, when needed, to those who have no legal claim to government allowances but a moral claim to Red Cross interest, owing to the fact that they have earned the right to depend upon men now in the service. A second large group, who have no legal claim on the government, have been formally accepted by the Red Cross as their special responsibility, namely, families resident in the United States of men who are in the armies or navies of our allies.

A fourth opportunity will increase in importance with each month that our forces are engaged in active warfare. It relates to the returning soldier or sailor, more especially when he returns disabled. Whatever can be done through specialized hospital and institutional treatment will be done by the government, but the supremely important thing is the prevention of permanent disability. In this many forces will have to cooperate. In so far as these forces are local, the Home Service section of a locality will have to carry forward the work begun in hospitals and in government training shops. The non-institutional side, the readjustment to actual home conditions, the fitting men back into industry after discharge, the interesting of individual employers, the organizing of local resources for further training and the development of a helpful and stimulating attitude toward these men throughout the local community-these will become Home Service tasks.

Finally, a fifth opportunity for Home Service workers lies in the desire of relatives of enlisted men for information of many kinds. Already this service is widely extended. Home Service sections are advising how mail should be addressed to soldiers and sailors; how information may be obtained of those sick, wounded, captured, or missing; what the war risk insurance law means and how to take advantage of its provisions. This work will be vastly extended and will save untold anxiety and suffering. It will serve immensely to maintain the comfort and health of these families, who have spared their breadwinners and protectors to the service of their country, and thereby also to sustain the morale of the fighting men themselves.

#### COOPERATION WITH WAR RISK BUREAU

THE Department of Civilian Relief has, with the cordial approval of the Bureau of War Risk Insurance, already undertaken to inform the relatives of soldiers and sailors who are entitled to family allowances and to compulsory altoments of pay, of their rights under this law. This is an immense task and one most logically related to the purpose of Home Service.

It is not to be understood that Home Service workers will invade the homes of all soldiers and sailors without invitation to offer suggestions that may not be desired. The fact that such information is available, with sympathetic advice and assistance in filing out application blanks, will be made known. Those who find the help desirable will be welcomed at the office of each Home Service section.

It may be well to add in this connection that an enlisted man's wife and children are entitled to the family allowance that the government provides from the mere fact that they are his wife and children. There will be no examination into the question of their financial condition.

The war risk insurance law provides also for voluntary allotment of pay by the listed man to parent, grandchild, brother or sister, and to any of these also a family allowance under three conditions. First, the enlisted man must make as allotment of at least five dollars a month, or one-seventh of his pay, whichever is greater, and apply for the allowance. If he is not making a compulsory allotment to wife or children, he must first allot fifteen dollars a month, or up to one-half of his pay. Second, the relative must be actually dependent, which is pay. Second, the relative must be actually dependent and allowance combined cannot exceed the average amount, monthly, that the man himself has been habitually contributing during the period of dependency, but not exceeding the year poir to this clustisment, or prior to the enactment of this law.

The Home Service sections are not stimulating the expectations of such relatives of enlisted men or advising them to apply for family allowances. The application must be made by the enlisted man, and by him only after he has made an allorment. Such expectation, if it exists, can be fulfilled only upon the voluntary initiative of the man in the service. Whatever desire such prospective beneficiary may have should be communicated to the enlisted man, who must make the allorment and the application before the Bureau of War Risk Insurance can have any interest or duty in the making of an award.

#### SOCIAL WORKERS AND THE LAW

I N last week's SURVEY, Lee K. Frankel is quoted as recom-mending to the "directorates of social agencies having in their employ men and women properly trained and qualified to do investigational work in the home, that they offer the services of these men and women to the War Risk Insurance Bureau if such service be needed and desired." It is Dr. Frankel's thought that the law granting an allowance to parent, grandchild, brother or sister, under stated conditions, presupposes either the presentation by enlisted men of indisputable proofs of dependency or investigation of the economic status of each enlisted man's family." "Assuming," he adds in the speech from which the statement above is quoted, "that dependency had been established by such investigation, subsequent investigation would be necessary to ascertain whether dependency persists." It is in the making of such investigations that social agencies are advised to contribute the services of their employes in order to promote "an efficient administration of the family allowance act, upon the success of which the proper conduct of the war may depend."

The whole purpose of this law is to afford compensation for loss of support, for injury and death, for loss of insurability -not to distribute charity. Judge Julian W. Mack, who drafted the bill, has said: "Congress wanted it understood that it is not a gift; it is not charity at all; it is additional compensation." It is therefore interesting to consider with what favor Congress and the people of this country would regard such well-intentioned activity on the part of social workers, and to consider also with what favor the families concerned would regard primary and subsequent investigations to ascertain whether dependency exists and persists. Would not public opinion quickly require the cessation of such visits by the regularly appointed agents of charitable organizations? Is it not possible and desirable that the Bureau of War Risk Insurance should accept the other alternative and require from the enlisted man and from the beneficiary satisfactory evidence of dependency and of his habitual earlier contributions to the support of the beneficiary? The enlisted man when the application is made, and the beneficiary when the allowance is accepted, must certify to the essential facts and conditions upon which the award of an allowance is conditioned. They know the facts better than anyone else. The government will require them to state these facts under severe penalty for any willful misrepresentation-no matter what other statement may be made by a social worker.

When it shall occur that formal inquiry by the Bureau of War Risk Insurance is made of a prospective beneficiary only conditionally entitled to the allowance, and that person desires or accepts the assistance of a social worker in making answer to the formal questions in satisfactory form, then the possibility of service appears. It is apparent, however, that such statements made under penalty must be the statements of the beneficiary and of no one else. And it is equally apparent that statements so made should not be called into serious question except the contradictory evidence is submitted in similarly solenn and responsible fashion.

There remains to be considered the need of inquiry when an honest mistake is suspected. The Bureau of War Risk Insurance has full power to make such inquiry and to take sworn evidence regarding such matters. In this way only does a satisfactory conclusion of such questions seem possible.

In the event that the bureau should desire to make blanket inquiry concerning the dependency of those relatives only conditionally entitled to allowances, may it not depend upon the exemption boards with greater certainty and advantage than upon the voluntary services of social workers? The exemption boards are official bodies. Their combined jurisdiction covers every acre of this land. There is a record of the examination of each drafted man, and in this record are his statements as to those dependent upon him at the time of his examination, unless indeed, because of his desire for service, he failed to claim exemption or to state the fact of such dependency existing. If he failed so to state for such reasons may it not be proper for a country, grateful for his service and sacrifice, to accept without "investigation" his solemn statement, confirmed by the equally solemn statement of the beneficiary, as to the dependency of a relative to whom at the time he is voluntarily allotting a part of his scanty pay?

#### MANUFACTURE

Printed 977,250 copies as against 937,925 the preceding year. Delivered 1,346 text pages to each subscriber—an addition of 115 over last year

Despite an increased charge of \$5,300 for paper, reduced ma pite an increased charge of \$5,500 for paper, reduced man-ufacturing costs to \$27,528,93 against \$28,109,19 for the corresponding period last year by favorable printing ar-rangements entered upon last fall, exocting economies in handling matter and cutting down exchanges.

#### COMMERCIAL RECEIPTS

Wrote \$8,514.78 in advertising; \$254.30 less than in 1915-16, or \$1,483.23 more than 1914-15. Secured gross subscription revenue of \$39,631.40, or \$895.84

more than the preceding year.

Secured 6,519 new subscriptions; or 525 more than precraing year.
Secured 986 restorations; or 80 less than preceding year.
Secured 9898 renewals; or 16 less than preceding year.
Altogether 16,489 subscriptions; or 421 more than preceding

Brought special groups of college subscriptions (used as sup-plementary tests in sociology, social science, economics, etc.) to a new level of 2,628; or 390 more than the preceding year.

#### ADMINISTRATION

Reorganized the business office under a new manager.

FINANCE AND MEMBERSHIP

Continued to hold our roster of \$10 cooperating subscribers to the thousand mark (total for the year 1,025 as against LOAI last year).

Registered 849 renewals of \$10 cooperating subscribers as against 734 last year.
Raised \$31,242 (all funds) for educational work (against \$29,012 the preceding year); \$9,846 from new sources.

Suffered reduction of, roughly, \$1,550 in grants.

Increased and decreased support in sums ranging from \$10 to \$1,500 as follows:

6 to \$1,000 contributions from \$200 to \$500 \$25 to \$100 \$10 96 " 14 00 1,041 " 1,025

Raised special fund of \$3,000 pledged onnually for support of Foreign Service Department.

Membership representing 42 states and 5 foreign countries.

#### THE SURVEY'S ORGANIZATION

SURVEY ASSOCIATES, INC., is a membership corporation, chartered November 4, 1912, without shares or stockholders, under the laws of the state of New York-

"to advance the cause of constructive philanthropy by the publication and circulation of books, pamphleis, and periodicals, and by conducting any investigations useful or necessary for the preparation thereof."

Annual Membership in Survey Associates is open to (a) Cooperating Subscribers of \$10 or more in any one year and (b) Survey Circulators. A cooperating subscription includes the \$3 subscription to the magazine, and creates no financial liability on the part of the contributor. Contributors of \$100 or more are eligible to life membership.

THE ANNUAL MEETING OF SURVEY ASSOCIATES is held the last Monday of October to elect officers and transact such other business as may come before the meeting. The directors are di-vided into three classes, whose terms run for three years. The voting is open to life members and to annual members.

# A Year of Survey Associates

Comprising the annual report of the Survey to its members and a financial statement for the year past, together with some announcements and plans for the year to come.

## By Paul U. Kellogg

HE entry of the United States into the war has profoundly affected every reach of American social life and every social relationship. It has halted some nascent forms of philanthropic work; jeopardized not a few regular and needed activities; demanded that all function in new ways. At the same time it has thrown open wide ranges of vigorous patriotic service and, through recasting governmental and private relationships has introduced fresh urgency into half-achieved reforms and undertakings.

#### A CALENDAR OF OPPORTUNITIES

SO it is that, in the view of board and staff, the SURVEY has before it the opportunity of a generation:

TO HELP KEEP American social work and administration from being shelved.

TO HELP MAKE American social service count throughout a war for democracy.

TO HELP MAKE this service doubly effective in the time of negotiation, settlement, and reconstruction, and after that to make it parallel the spread of American investment in new fields of commercial and industrial enterprise.

In these new international activities, as in our municipal, state and national activities, the social movement will be needed not primarily as a mender and patcher of things, but as an affirmative force. And the SURVEY can be one of the most powerful channels through which this sweeping movement for reform expresses itself, because it has followed closely each step in social progress, because its criticism and suggestion are the compound of long experience, because it has always been a journal of constructive social thinking.

Already the SURVEY, as a cooperative undertaking, thoroughly representative of the American social movement both in its cleavages and in its agreements, has not only held intact in this decisive period of American history, but has proved its usefulness as guide and chronicle in the midst of the rapid changes and crystallizations of public opinion.

#### FIRST CONCERN OF THE SURVEY

F prime importance is the first item in the SURVEY'S calendar of opportunities-to help keep industrial, civic and social welfare in America from being impoverished by sluicing all money and energy into war activities. In the midst of the general preoccupation with the war, no less than in our period of neutrality, the momentum and increment of solid social progress are a special charge on the new world, removed as we are from the actual area of conflict. How the Survey has helped and can continue to help, may be illustrated by certain lines of development which have been carried out this year.

#### The Industry Department

IN THE industrial field, by means of special contributions covering traveling expenses, Mr. Fitch has engaged in a two

months' piece of field work which took him to the Pacific coast. In California he made an analysis of the proceedings in the Mooney trial, affording eastern people their first unbiased and authentic transcript of that labor issue; in Colorado he checked up developments in the Rockefeller coal fields since the great strike of 1913-1914, and endeavored to gauge how the Rockefeller plan of labor adjustment has panned out.

In the East, Mr. Fitch has made a study of the "new profession of handling men." To keep plants fully manned in many industries, new workers are hired every year in numbers equal to from 100 to 300 per cent of the number of employes on the payroll at any time given, and at a cost of from \$25 to \$100 per man. In the last few years employment managers' associations have sprung up in various cities, grounded in the belief that the employer should study the question of hiring and firing with the same degree of thoroughness that he studies other items in his business. After observing conditions in a number of typical factories, Mr. Fitch reviewed the methods of organizing these new employment departments and the results obtained. His investigation proves that not only does a more efficient system transfer hiring and firing from the foreman to a high class executive, comparable in responsibility to the superintendent of production, but directed as it is to making conditions satisfactory to the employes so that they will not leave, places welfare work on a democratic, mutuallyrespecting and business basis, instead of on a basis of paternalism. Furthermore, in a period of war, when the country is faced with a labor shortage, when industrial waste is a national embarrassment, and increased production a national asset, the spread of information as to this movement becomes of particular significance. Mr. Fitch's study, the first by a detached observer, is being circulated in reprint form.

In the Middle West Mr. Fitch visited a group of progressive industrial centers to find out what is being done to conserve the human factor in industry and at the same time to stimulate production. His gleanings, again given opportune emphasis by the war, will be published in the current volume of the SURVEY.

Still another feature of the industrial department of the SURVEY, bearing directly on the problems of industrial relations to the fore last fall in the railway controversy and to the fore this fall in the general unsettled labor situation, was a special number given up to discussion of the Canadian industrial disputes act. Here was presented the gist of Mr. Selekman's study, for the Russell Sage Foundation, of nine years' operations of the act, accompanied by criticism by Charles W. Eliot, John R. Commons, J. E. Williams, William O. Thompson, James O'Connell, James C. Watters, H. R. Towne, Harris Weinstock, and Elisha Lee.

#### The Health Department

BECAUSE state administration of health has been one of the weak links in public defense, it was taken as the major subject for study by Dr. Alice Hamilton and Gertrude Seymour, of

New York, Oct. 27, 1917. Certified Public Accountants.

the Survey staff. Through the courtesy of the American Medical Association, they had access to Dr. C. V. Chapin's critical study of state board work, but drew also on original material from forty-one state boards of health and on bulletins, regular and special, received during two years.

This inquiry showed public health work as a new profession, with its own special training as a first sentral. It demonstrated the urgent need everywhere for recognition by citizens of what their health officers are doing, trying to do, or should be trying to do. It paved the way, moreover, for intensive study of several types of health work in industrial and rural communities, and of such cooperation as that first accomplished in Massachusetts and soon imitated in Illinois and California, where small towns combine under a trained health officer.

All that the health department hoped to contribute through its studies of the public health movement toward this closer cooperation of social and official agencies has been done, and much more, since last April, by the very emergency which it was feared might overwhelm health activities. Said an officer now in the "civilian health zone" service: "Never in my experience have I seen such an interpenetration of interests in health service. The social and the scientific and the economic are at last one in this big undertaking."

The Survey holds a unique position relative to such circumstances. It is in touch with every center of activity and has the cooperation of leaders in every field. It has the remarkable opportunity of seeing the various new lines of work and getting first-hand and authoritative material showing developments from their true angle—that of social progress. This material needs no longer to be a plea for existence or support. There is no question today as to the worth of child conservation, sanitation of food sources, of cities, camps, industrial context, and the intervening rural districts as well. The urgency is to get the work done, done quickly, done well; and to secure a permanent establishment of what is of permanent value in the life of the country.

#### Departmental Needs

THIS summary of achievement in the industrial and health fields brings out what the SUREV is trying to do when it hitches its ambition to a group of departmental desks, not altogether different in conception from the "chairs" of universities. In other words, the SUREV staff concieve each year's work as demanding something more than current journalistic assignments something analogous to laboratory research.

Nor are we disposed to abandon this ambition because in the vicissitudes of these years a rounded development of our editorial work has been impossible in such fields as that of civics, in which the responsible editor, Mr. Taylor, has been on leave of absence in Russia, or in crime and education, to which Mr. Lane has been able to give but fragments of time.

There is considerable historical justification for linking the editorial handling of poverty and the economic cause of distress with the handling of case work as it enters not only into charity organization work, but into child welfare, into hospital social service, probation and the like, and we shall not be measuring up to cither our obligation or our opportunity until we have a responsible editor giving full time to matters affecting the relief and treatment of dependents.

The fact that we have during this current year successfully instituted a foreign service desk (of which more later) eacourages this hope for staff development.

#### The Managing Editor's Desk

ALL departmental affairs, whether in industry or health or in the foreign field, are merged into the main stream of jour-

#### FINANCIAL APPEAL

#### SURVEY ASSOCIATES. INC.

As a journal of constructive philanthropy, the SURVEY endeavors to get at the facts of social conditions and to put those facts before people in ways that will count. As an educational enterprise, with circulation not yet large enough, nor advertising yet sufficient, jointly to meet publication expenses, much less journalistic research, the Survey must look to contributions to make its larger work possible.

As an adventure in cooperative journalism, 1,021 contributors of \$10 or more made up the active membership last year of Survey Associates, Inc.

Today the need for effective support of such a journal as the Suavey is doubly imperative. Never has it been so necessary to understand the grave social and industrial issues which the war has brought to the fore; to keep alive the old forms of social service; to pool the experience and wisdom of leaders in social work; to arouse a spirit of social usefulness.

#### GENERAL APPEAL

To carry the Survey forward in 1917-18 we appeal for \$25,000 for our General Educational Fund,

#### COOPERATING SUBSCRIBERS (\$10 each)

During the past year, 1.021 readers enlisted as Cooperating subscribers to Survey Associates at \$10 each.

In order that the financial backing of the Survey may be on a sounder and fairer basis, we appeal for 1,500 \$10 cooperating subscriptions in 1917-18.

#### LARGER CONTRIBUTIONS

In these years of retrenchment we must look to those of larger means and equally constructive vision for the remainder of our General Fund. We appeal for \$10,000 in sums of \$25 to \$1,000.

#### ENDOWMENT FUND

Survey Associates, Inc., is in position to administer a short-term endowment fund, to be applied during this period of growth to our gen-eral work, or to certain well-defined lines of ac-tivity which would amply justify philanthropic investment.

(For audited financial statement, 1916-17, see page 192; for summary of year's work, page 190. Checks abould be drawn to Frank Tucker, treasurer, SURVEY ASSOCIATES, INC., 112 East 19 street, New York

#### SPECIAL APPEALS

#### SURVEY ASSOCIATES. INC.

#### INDUSTRY

This department, made possible on its present scale by special contributions, has passed the ex-perimental stage, and sets the standard toward which we hope to bring staff resources in the other major fields of social concern interpreted other major neits of social concern interpreted by the Sunvey. The standard must be maintained this year of all years, when such matters as labor adjustment, labor efficiency and labor content-ment are as important to the prosecution of the war as fighting-men and finances

#### THE FIELD

Beginning with incapacity and exploitation in the worka-day life, the upward trend in industrial conditional transportation of the control of the control of the labor legislation, collective bargaining, profet-sharing, and tory inspection, aslety, hygiene, scientific management, social invention and cooperation in industry.

#### We appeal for \$5,000 in 1017-18 HEALTH

That the health editor may continue to conduct first-hand investigations into health problems, an increased budget is needed for traveling expenses and for clerical assistance in handling the mass of incoming material.

We appeal for \$1,000 in 1017-18

#### FOREIGN SERVICE

A wide range of opportunity opens up in interpreting:

The work of relief and rehabilitation in Europe.
The administrative and legislative experiments attempts to the state of t

To carry out this program, \$3,000 has been pledged annually. This covers the salary of a special editor and the bare expenses of the department. It does not allow for adequate traveling expenses and clerical help. We appeal for an additional \$1,000

annually for three years.

#### CIVICS, EDUCATION AND CRIME

The coming year our treatment of the social aspects of these major fields is attempted by part-time adjustments of the headquarters staff. With time adjustments of the headquarters staff. special contributions, we should be in position to bring our work in each of these fields up toward the standard indicated above.

#### RELIEF AND LIVELIHOOD

Our purpose is to parallel the departmental work in industry, health and foreign service, with a similar equipment—full-time of a responsible editor-devoted to the experience, experiment, and investigation, in the oldest field of social concern covered by the SURVEY.

COVETED VIEW DUBLET.

Beginning with pauperism and poverty, the upward trend
in social economics including such subjects as relief, rebudgets, thrift, and cost of living, remedial loans, mutual
sid, social insurance against eickness, accident, invalidity,
we appeal for \$5,000 to develop this department.

nalistic work of the managing editor's office. During the year we have published a succession of opportune articles on current developments, either the results of quick staff inquiries, the free contribution of writings from leaders in social work. or the findings of original social investigations. Such were:

Winthrop D. Lane's review of the Strong report on the children's charities of New York.

President John H. Finley's interpretation of the work of the New York Military Training Commission. Dr. I. M. Rubinow's description of the spread of the health insur-

ance movement. John A. Fitch's analysis of the railroad labor controversy. Dean Hodge's appreciation of twenty-five years at South End House.

Robert A. Wood's account of the sweep of the prohibition cause. Graham Taylor's interpretation of the movement for unified muni-

cipal government in Chicago.

J. B. Gwin's report on Red Cross work for Mexican refugees at the border.

Winthrop D. Lane's review of Warden Osborne's administration at Sing Sing.

Norman Thomas's interpretation of the attitude of conscientious

objectors Dr. Herman Biggs' findings as to tuberculosis in France. Esther E. Baldwin's analysis of the European War Relief organizations in the United States.

Winthrop D. Lane's portrayal of the revolution in public charities in an American county, Westchester, under V. Everit Macy.

Amy Hewes' study of the Bridgeport munitions workers for the Russell Sage Foundation. Shelby M. Harrison's summary of the Springfield Survey.

John Ihlder's study of housing in the war boom powder town of

Hopewell.
Helen B. Pendleton's story of the migration of southern Negroes to the North

Attention-provoking and valuable as such features are, neither in investment of staff time nor in service to readers are they comparable with the week to week paragraphs of the Common Welfare, ranging from three inches to a page in length, in which are chronicled events and conditions in each subject field, so that the settlement worker, the charity visitor, the labor inspector, the health official, the socially minded physician, lawver, minister, citizen may keep in touch with each other and abreast of social progress the country over. Our western office at Chicago, and our Washington correspondent (in a year in which Congress has been almost continuously in session and the administrative departments of the government have embarked on war-time policies affecting every phase of the common life), are our two chief outside sources of information. They presage what the SURVEY should offer when it can maintain a system of news and comment which shall be truly national.

#### WAR-TIME SERVICE

BUT although the first obligation of the SURVEY is to in-terpret developments in American social work, it is impossible to maintain a narrow, insular outlook when every part and aspect of social work have been complicated by the war, when every social and industrial condition in America have been affected by the changed status of similar conditions abroad. Consequently the scope of the SURVEY has expanded. While the general bearings of the war and of military operations absorb the newspapers and general periodicals, the Survey has endeavored to play a constant stream of information and criticism on the war-time phases of social work and the social phases of war activities. We have the staff and cooperative relations with a score and more of the national social organizations which enable us to do this with almost no extra overhead expense. We need money for additional pages, for traveling expenses to enable us to gather dependable information at camp centers, in industrial districts and warswept areas.

#### Foreign Service Department

ONE of the chief means by which the SURVEY has been enabled to collect foreign material and to compare conditions of life and labor here and abroad, has been the establishment of a foreign service department. The purpose of such a department was outlined in last year's annual report. It was pointed out that the Survey had long wanted to pool foreign as well as domestic social experience, and that at a time when the war had snapped many international links which hitherto, if only here and there, had provided social workers with accurate knowledge of contemporaneous activities in their fields, the Survey should endeavor to forge one such link of communication. The entry of the United States into the war and its sharing in the resulting tremendous social consequences of the conflict, make such a work of translation a thousand fold more immediate and serviceable.

Three considerable gifts made it possible for us to announce the organization of the department in January. To complete the fund we conceived the idea of building up a group of fifty cooperating subscribers to this department among American Quakers, a body who are becoming more and more interested in industrial and social welfare. It has been the Friends who for three years, through their War Victims Relief Committee (supported jointly from England and America), have carried on that pioneer work of household rehabilitation in

the devasted regions of France which has blazed the way for the large scale program of the American Red Cross.

The SURVEY called to this new desk Bruno Lasker, recently on the staff of the Mayor's Unemployment Committee of the City of New York, who brought to his task the necessary technical equipment and wide acquaintance with men and measures abroad.

Under the new department, the needs of foreign war relief have been followed to the extent of giving current information on such urgent demands on American generosity as those of Belgium, Poland, Lithuania, Palestine, and Armenia. Foreign experience in the solution of, or failure to solve, industrial and educational problems arising out of war conditions has been analyzed in articles and news paragraphs dealing with the health of munitions workers, women's labor generally, the treatment of conscientious objectors, cooperative production, the teaching of cripples, the control of food distribution and of drink. The physical tasks of reconstruction in France and Belgium, especially the rebuilding of towns and cities, land settlement (not only of discharged soldiers) and realignments in social and industrial relationships have been discussed. Efforts made in the liberal countries to guard democratic institutions have been followed. Material has been collected bearing upon the claims to freedom and to social security of the smaller and subject nationalities whose interests may be overlooked at the time of peace unless sympathetically represented by socially minded people in the larger countries especially in the United States. There are in preparation a number of related studies of foreign plans now maturing for utilizing the demobilization of great armies to advance social reform.

#### Mobilization of Social Forces

THE foreign service department, however, has dealt but incidentally with America's relation to the war. This has been the concern of every editor on the staff wherever war has altered the problems with which he or she was dealing. Furthermore, at a meeting of the Survey's Board of Directors in mid-winter, the war-time service program, published on the opposite page, was adopted. The SURVEY also called together, early in April, the executives of a score of national agencies to tell of their plans, the special difficulties which the war threw upon them, and the way the SURVEY might help. The consensus of opinion was that in acting as a medium for the exchange of information and criticism, and for bringing rapidly before the whole body of social workers the programs formulated by these national bodies, the Survey had before it an opportunity for unique service such as has seldom come to an educational enterprise. Thus, while the SURVEY was one of the few channels through which those who had opposed America's entering the war could get a hearing, its staff and space were prompt to serve the mustering of social agencies in a national emergency.

In line with the above plans and recommendations, the SURVEY has continued to bring out material that has not only been interesting and instructive to its readers, but has been turned to use by other agencies. Such were:

#### A CANADIAN CITY IN WAR TIME

By Paul U. Kellogg.

1. The Patriotic Fund and the Women of Montreal, March 17.

2. Families of Soldiers Overseas, March 24.
3. Way-marks in Organized Giving, March 31.
4. The Bauleground for Wounded Men, April 7.
5. Recruiting and the Man-Power Inventory, April 21.

5. Recruiting and the Man-rower Inventory, April 21.
Going to the belligerent country nearest our own in location, character, and form of government, while the issue yet hung in the balance, the leadership and experience which Canada had to offer were so tremendously significant that later they became a distinctive feature of the National Conference of Social Work at Pittsburgh.

The first three of these articles were immediately sought by the American Red Cross as a reprint for all its chapters, three editions were run off, and a fourth was distributed in Canada by the Canadian Parriotic Fund. They inspired the New York School of Philanthropy to arrange a course for civilian relief workers. These lectures, by Porter R. Lee, as condensed by Karl de Schweinitz, appeared from week to week in the SURVEY under the title of The Task of Civilian War Relief. They were used as current texts in training courses and study groups in the following cities in May, training courses and study groups in the tollowing cities in May, June and July: Washington, D. C.; Augusta, Ga.; Chicago; Fort Dodge, Iowa; Lexington, Ky.; Boston; Kansas City, Mo.; Atlantic City, N. J., Newark, N. J.; Albamy, N. Y.; Auburn, N. Y.; New York city; Yonkers, N. Y.; Hamilton, O.; Erie, Pa.; Harrisburg, Pa.; Seranton, Pa.; Newport, R. I.; Milwaukee, Wis.; Philadelphia; Denver; Atlanta, Ga.; St. Louis, Mo. They have since been revised by Mr. Lec and brought out by the Red Cross as a text book for its comprehensive course of instruction for home service workers throughout the country.

Mr. Kellogg's presentation of the Canadian system of soldiers' pay, separation allowance and Patriotic Fund grants helped crystallize public sentiment in support of completely revamping the old military pay and pension system, inherited from Civil War days. Similarly the review of the work of the Canadian Military Hospitals Commission was turned to instant use in New York in formulating a state program of provision for recruits rejected by the examining physicians because of incipient tuberculosis. It also broached the whole problem of care and re-education of crippled soldiers.

TURNING OFF THE SPIGOT

By Elizabeth Tilton. 1. What Makes Men Stop Drinking? January 13.

2. What the Nations Drink. January 13.
3. What Grandfather and Father Thought About Drink

January 27. 4. The Early Prohibition Wave. January 27.

5. The Prohibition Wave-Better for Business and Better for Boys. February 10.

6. Is Beer the Cure for the Drink Evil? February 24.

7. The Casc Against Beer. February 24.
8. Prohibiting Distilled Liquors and Keeping Beer. February 24.
9. Do We Want the Gothenburg System? March 10.

Mrs. Tilton gave her time, the Survey put up the traveling expenses, and Prof. Irving Fisher, long a leader in the cause of scientific temperance legislation, collaborated in the revision of the manuscripts. These articles supplied what had long been searched for, an appraisal of the social consequences of prohibition in the South and Middle West. War made the liquor issue of tremendous national importance, both in its bearing on the food supply and on the national health and fitness. The articles were promptly reprinted in an edition of 25,000 copies by the American Issue Publishing Company to further the agitation before Congress, in which Professor Fisher and Mrs. Tilton were active factors, and which resulted in the passage in September of a war measure prohibiting the manu-

facture of distilled liquor.

WAR-TIME ECONOMY AND HOURS OF LABOR By Alice Hamilton, M. D.

The British official reports on the relation of hours of work to health and output in munitions were reviewed by Dr. Hamilton, a member of the Survey staff and the federal expert on occupational diseases. The fortnight war was declared, her points were made use of by the American Association for Labor Legislation and the National Consumers' League to stem the first stampeding towards a

general repeal of state factory laws. MAKING THE WAR SAFE FOR CHILDHOOD

By Winthrop D. Lane.

1. The Case for Conservation. August 4.

Schooling and Child Labor. August 4.
 Boys and Farms. August 4.

4. The Nation's Youngest. August 11.

5. Delinquency in War Time. August 25.

Mr. Lane's first-hand enquiry into the earlier English experience with war-time child labor and the schools (a breakdown which has aince led, because of its serious social consequences, to a general re-vival of concern for public education in England) was promptly drawn on by the National Child Labor Committee in Jaunching its program of war-time protection for American children.

SOCIAL FORCES IN WAR TIME By Edward T. Devine.

At the National Conference of Social Work in Pittsburgh, the center of interest lay in the program of an emergent committee on social problems of the war, of which an associate editor of the Suzury, Edward T. Devine, director of the New York School of Philanthropy, was chairman.

Mr. Devine practically expanded this session into an all summer's seminar, by reopening his characteristic department of Social Forces as a weekly feature of the Survey. In this he took up such current developments as the reorganization of the Red Cross, the morals of

#### THE SURVEY'S WAR-TIME SERVICE PROGRAM

TO INTERPRET social work and needs in the fields to which it is historically committed and which will have small

attention in the general press.

TO INTERPRET the application of social technique and leadership to the civil activities paralleling military operations—such as relief and Red Cross work, the recreation commission, the medical and vocational work for invalided soldiers, the emergent social problems of garrison cities and a great number of other forms of emergent public service.
TO INTERPRET the movements for social control over

food supplies, the encouragement of thrift and the conservation of wealth, all tending to maintain social fitness in the general civil population during the period of stress, and to free it from an overwhelming load of debt which will mortgage the social welfare of the future.

ciency by maintaining labor standards and education.

TO INTERPRET the work of settlements and other agencies to promote social fellowship, reduce racial animosities and hatred, advance national cohesion among our immigrant population, and prevent the breakdown of tolerance

d personal liberty essential to normal democratic life. TO INTERPRET the social aspects of movements towards enduring peace and an international fabric which will prevent the recurrence of the miseries of war and make the world safe for democracy and secure for social progress.

TO INTERPRET the social undertakings of war relief.

reconstruction and settlement, and the advances and experience in administration and legislation worked out under pressure of the war here and abroad.

soldiers and civilians as affected by the war, pensions and separation allowances, the social treatment of resident aliens and of war prisoners, the conservation of labor, thrift and economy, the food question, conscription, and war prohibition. The series began in early June, and continued to mid-August, when Mr. Devine was made chief of the Bureau of Refugees and Relief under the American Red Cross in France, charged with responsibility for making American funds and energy count in aiding France to care for a million and a half homeless folk.

#### Another Angle of Survey Service

THIS mention of the honor and trust conferred upon Mr. Devine, leads to a fuller statement of the extent to which the government has drawn upon SURVEY personnel, and of the unselfishness and devotion with which our group has responded.

Thus, three members of our Board of Directors are members of the executive committee of the American Red Cross which, once war was declared, automatically changed from a private agency to a semi-official arm of the federal government. Two members of our National Council are members of the new Red Cross War Council, another its commissioner for Belgium, a contributing editor a member of its Commission to Rumania's, a former contributing editor and long-time associate, the director of the Department of Civil Affairs under the Red Cross commissioner to Europe. Still another member of our National Council is chairman of the Rockefeller Tuberculosis Commission which is embarking on a long-range educational campaign in France unmatched in the history of public health. Two more are serving in the army, one as a physician at a base hospital in France and the other as an engineer assigned to the construction of one of the large cantonments.

At home, also, the government called one member of our National Council to membership on the Advisory Commission of the Council of National Defense, and one of our Board of Directors to membership on an advisory committee under the auspices of the council. Another member of the board was asked to draft the progressive system of family aid, compensation for death and injury and insurance, for the armed forces of the United States. A contributing editor has been placed by the War Department on the important committee charged with safeguarding the standards of working conditions in government contract work.

Several members of our Board of Directors and National Council were active participants in formulating the tidal sentiment for America's joining forces with the allies. Two were active in constructive peace movements at a time when such espousal meant extraordinary personal courage, risk of misconception and jeopardy of work into which they had put their lives. Four members of the board have made outstanding contributions to the new and vigorous literature of internationalism which concerns itself with the problems of enduring peace, of the liberation of oppressed peoples, and of a fabric of security and justice such as shall not only free the world for democracy, but free it for a renaissance of social well-being.

What is true of the SURVEY'S board and council, is, of course, true of the general ranks of social work. Yet to have held the SURVEY group together, and to have carried conviction in spite of conflicting opinions and activities, has itself been no mean achievement and is an augury for the coherence and liberalism of the social movement of the future.

The editor of the SURVEY, as this report is issued, is likewise in France assisting in organizing means for interpreting the unprecedented work of the Red Cross to the American soldiers in France, to the French people and to the American public at home. His time is a contribution by the SURVEY to the Red Cross, and his responsibility to the Red Cross will not interfere with his status as observer in preparing a series of articles outlining the great phases of the work entered upon. This undertaking should be followed in much the same way that the engineering journals followed the building of the Panama Canal. It is the most signal illustration of the second great opportunity set down at the outset of this statement as something in which the SURVEY may share; namely to help make American social work count in the midst of a war for democracy-by applying its technique and organized resources so as to lift the participation of the United States to the least socially destructive level, and so as to set going the processes of salvage and reconstruction.

#### THE GOAL AHEAD

THERE remains to refer briefly to the third opportunity before the SURWEY—To help make American social work count in the time of negotiation, settlement and reconstruction, so that the human preciousness of democracy may be treasured here and abroad. Again, we are indebted to Mr. Devine for the most considerable contribution of the twelve months, his series of articles on Ourselves and Europe, in which he summed up impressions of a year ago when traveling through Russia, Germany and other countries. Throughout the year, too, we have brought out distinctive material on the social factors entering into international relations, from the remarkable state papers of President Wilson to the terms of peace proposed by the Italian Socialists.

It was at the suggestions of a member of the staff of the SURWEY that the Academy of Political Science in the City of New York, held its three days' conference at Long Beach in May. The conference was opened by former Justice Hughes and was attended by a remarkable company of university men, social workers, journalists, lawyers and labor leaders. In a sense it staked off the claim of the lay public to a pro-

found concern in the formulation of foreign policy—the claim of just such social groups and forces as, cumulatively, have made themselves felt for the public interest and for social progress in municipal, state and national life.

#### EDITORIAL STEWARDSHIP

THESE functions of chronicling, investigating, and interpreting have been emphasized in building up the SURVEY in the last five years, and with them the equally clear function of offering a meeting place where social workers and thinkers may make serious contributions from various points of view. These educational functions have consciously been given right of way over another element; an independent editorial column, necessary to any journal worthy of the name. The editor has been less interested in using the SURVEY as a pulpit than in making it a forum for the most vigorous and searching thought of men and women who have given their lives to the service of their fellows.

Survey Associates has never accepted gifts to its educational funds on the basis of positions taken in contributed articles or editorials. Such a procedure would either turn the SURVEY into a propaganda journal or leave it straddling all the fences around the lot. Rather, in this period of development, by emphasizing and setting off clearly those educational functions on which staff, council, and cooperative membership may reasonably be expected to achieve a common basis both for service and support, we have essayed the difficult task of projecting a cooperative journal in a field where a dozen controversial questions are always to the fore and where new questions arise on which it is foolhardy to expect agreement even among those most directly concerned in the management.

The relation of these educational duties, for which we have consistently sought backing, to editorial management and freedom were discussed in last year's annual statement by the editor, which concluded:

"If our news treatment is even-handed; if in our field work we set standards of investigation and interpretation which, while not ignoring the personal equation, command confidence; if our columns are open to both sides on germane issues, then we have a formula, and the only one which could possibly enable the editors of the SURVEY, with intellectual honesty, to cover a dozen fields of social concern in which students hold conflicting beliefs and hold them strongly. That was propress lies."

This formula has withstood the strain of many critical domestic situations; it has weathered the tension of two war years, and it successfully met the most acute test of all last winter when the issue of war and peace hung in the balance and when social workers and thinkers, in common with every other group in society, and from the very deepest reaches of feeling and belief, broke with each other on the social justification of America's entry into the war.

It has been on the clear understanding of such principles of scope, treatment, and stewardship that we have enlisted and conserved the contributions of time, money, writings and labor which have made the SURVEY not only possible, but a living enterprise. They have carried conviction through periods of stress and have cleared away misunderstanding. They are bone and sinew of our functioning as a free press for the constructive social work and movements of our country.

THE TOWN LABOURER 1760-1832 By J. L. Hammond and Barbara Ham-mond. Longmans & Co. 346 pp. Price \$3.50; by mail of the Survey \$3.70.

ECONOMIC DEVELOPMENT OF MODERN EUROPA By Frederic Austin Ogg. Macmillan Com-pany. 657 pp. Price \$2.50; by mail of the SURVEY \$2.70.

The Industrial Revolution 

The book of Mr. came to us with strong recommendations from two eminent British sociologists, and our expectation was corexpectation respondingly bigh. It was not disappointed. Though the writing trial history in Eng-land has in recent

land has in recent to a very bigh point of literary accomplishment combined with careful use of original sources and sound interpretation by such writers as Gibbert Stater, the Webbs, and others, there has been no similar publication so vividily describing this vital period of change.

The seventy-three years covered by this study, beginning with the accession of George III and ending with the enactment of the reform bill, represent, perbaps, the widest deviation of a great civilized community from common sense and the most serious addiction to abstract theories which has the least glorious period in English bistory, and this in spite of the fact that the political and social thinkers of the time imagined the nation had entered an era of unexampled liberty, progress and prosperity.

The abandonment of large masses of the population who had previously lived a per-fectly innocent and independent, if frugal, existence to an economic exploitation which no slave-owner in bis own interest would permit himself for a month, and to a helplessness before the law which stood in glaring contrast to the libertarian philosophy of the time, cannot be understood unless all the factors are known which brought about this rapid deterioration of the common

weal. Such knowledge the authors give with rare skill by substituting for a strictly chronolog-ical narrative a series of closely connected chapters dealing with the etlology of the social disease; the introduction of machine production and the new industrial disci-pline and living conditions which it brought about, the economic condition and, perhaps, about, the economic condition and, perhaps, most important because most lacking in pre-vious histories of the period, the psychol-ogy of the rich and of the poor, of the gov-erning classes and of the governed, their religious and political as well as their economic creeds.

As the modern museum tries to exhibit the fauna in its natural environment, thereby greatly enriching popular knowledge of animal life, so this close association of all the important elements in the picture of the time greatly helps our understand-

When from the chapters on child labor or the fight against trade unions we derive

the conviction that in spite of all the bad conditions which remain to be remedied, such cruelties are today no longer possible in a moderately civilized state, we have only to read some of the others to become equally conscious of the fact that the conditions which made for that cruelty might well be reproduced unless state and social policy be constantly subjected to the cri-terion of common sense. For, the masters of the period and the educated classes genof the period and the educated classes gen-erally, were by no means inhuman. On the contrary, sentiments of human liberty and progress were, perhaps, never before voiced more widely or more sincerely. It was the time of deep sympathy in Eng-land with the struggles of small nations and

of rather romantic notions about backward races. Sympathy for the oppressed at home was deliberately suppressed. Thousands of good and even noble people, often entirely disinterested financially, saw no alternative to the new methods and conditions of in-dustry than the old life of "inefficiency" and personal irresponsibility.

Their ideas concerning the good of the race and of the nation were derived from abstractions which lesser men in politics and industry made of the economic discoveries of Adam Smith, of Hume, of Malthus and of others. It required men of the type of Dickens, a generation later, brought up among realities and sufficiently far removed from the promising origin of these soul-killing theories, men who trusted their sympathies rather than their reason, to break down the barriers which the new science of political economy bad erected against natural feeling.

Does not the same tendency to theorize from practical experience marked the industrial revolution of England threaten in different forms and in different degrees all time and all nations? Do we not today see it expressed, for instance, in some of the more obvious aberrations of socalled scientific management and, most pronounced, perhaps, in the Prussian formula of the bureaucratic state?

The only way to guard against it is to retain a constant and conscious relationship between the different classes and races em-braced in the commonwealth, and to create a sense of citizenship in which the lowliest stand on an equal level with the strongest de facto as well as de jure. This history also teaches the need for a continuous teaching among all classes of the regard for per-sonality. Without it, the new socialistic orientation of industry which must inevitably follow the present war may again create an illusion of political democracy in a plutocracy not very different from that of the period under review.

In almost every chapter of Mr. and Mrs. Hammond's work are lessons for our time. Only a few of them can here be alluded to. The attitude towards "the poor, stance, was in many respects similar to that yet taken in this country towards the Negro:

"They were to have just so much in-struction as would make them more useful workpeople; to be trained, in Hannah More's phrase, 'in habits of industry and piety.' Thus not only the towns they lived in, the hours they worked, the wages they received, but also the schools in which some of their children were taught their letters, stamped them as a subject population; existing merely for the service and profit of other classes."

The procedure in the case of strikes often seems to have resembled that now frequently in vogue to meet the real or imagined dan-ger of the I. W. W .:

"The magistrates and their clerks recognized no limit to their power over the free dom and the movements of working men. The vagrancy laws seemed to supersede the entire charter of an Englishman's liberties. entire charter of an Englishman's libertues. They were used to put into prison any man or woman of the working class who seemed to the magistrates an inconvenient or disturbing character. . . One method was to arrest a number of men and then try to

make them compromise each other."
"Unfeeling Tyrants!" says a public manifesto of the mule spinners in 1818, "when we refuse to work and starve, you say we are conspiring against the Government, charge us with sedition, send for soldiers to coerce us and, in the Green Bag stile, assure the Governors we are plotting against them '

These quotations may suffice to explain the great practical value of this bistorical study for a proper understanding of present social phenomena and for an appreciation of dangers to social stability and economic progress which, in a different guise, are but too familiar to us today. We are glad to add that the authors promise a second vol-ume which will record in greater detail the history of the town laborer in a number of industries and give a full account of the Luddite disturbances.

PROFESSOR OGG'S Economic Develop-PROFESSOR OGG'S Economic Develop-ment of Modern Europe is bere linked to the volume just discussed, although it covers a much longer period because, in a sense, the transformation of Europe from a medieval to a modern industrial social organization forms its central theme. As in his previous volumes, The Governments of Europe and Social Progress in Contemporary Europe, the author is concerned with all western Europe, with occasional excur-sions beyond Prussia and Austria, but gives prominence to English experience which is of greater significance for American devel-opments than that of any other European

For the same reason, he also assigns more space to the more recent economic history than to that of the first three centuries of the modern epoch. The importance given to social insurance, which is dealt with in two chapters as the latest development in socialized national economy, would seem somewhat exaggerated in the general historical setting, especially if account be taken of the meager treatment accorded to such matters as the more recent movements in taxstion (other than tariff legislation) and the financing of public enterprise.

Naturally more conservative in statement than the book of Mr. and Mrs. Hammond. this volume forms an admirable companion to it, satisfying both the need for a knowledge of the economic and social history pre-ceding the period covered by them and the curiosity of the uninitiated reader who wants to know "what happened next?" It will be equally serviceable to illuminate more deperiod which it covers.

In many of the historical instances which this volume also brings surprisit gives, ingly telling lessons for our own time. To give just one example, it tells us that a healthy country life after the Seven Years' War enabled England easily to absorb more than a hundred thousand soldiers thrown upon the country for employment and sustenance, whereas after most of the wars following the deterioration of country life by the enclosure acts, and notably after the Boer War, the ex-soldier, as everyone knows, created a serious social problem.

The bibliographical references accompanying each chapter are without serious omission and most useful to the student. The judgment exercised in selection and in the discussion of controversial subjects throughout the book is admirable.

BRUNG LASKER.

PUTNAM'S HANDBOOK OF UNIVERSAL HISTORY G. P. Putnam Sons. 423 pp. Price \$2.60; by mail of the Survey \$2.72.

So excellent is this handbook that one experiences keen regret that it is not better. For a book which exists especially to correlate with the important dates of tory those of social significance, should not, for instance, have omitted any reference to the first factory act, that of 1802 in Great Britain. Ryland thought it worth while twenty-six years ago to include that date in his outlines, though his purpose was primarily literary.

The present handbook pays enough atten-tion also to matters of science and of art to have noticed that annus mirabilis, 1809, which saw the birth of Tennyson, Darwin,

Wagner, Mrs. Browning, to mention only a few of the galaxy. But withal, here is a large frame-work in which the student of affairs may study the setting of many of the world's great events. Should records of some of his favorite occasions prove to be missing, he may insert them himself, finding in the doing a further stimulus to attentive study. stimulus to attentive study. For its 171-and make-up, and its highly interesting charts, the book deserves all praise. G. S.

THE PROBLEM OF HUMAN PEACE
By Malcolm Quin. E. P. Dutton and Company. 275 pp. Price \$5; by mail of the SURVEY, \$3.20.

In the flood of books about this war, and tion of war, this volnme stands out as having a definite and distinctive content. It is not intended to show why we had this war or how it should be ended in the interest of world peace. It is a discussion of the

fundamental questions involved in war itself and the bases of a universal and permanent peace. The author is certain that Roman Catholicism "scien-tifically understood and completed," that is, thealty understood and comprete, then a Catholicism recognizing and accepting gladly "the movement of the human mind, unified and universal, and not to be arrested," is the true and sole basis for that 'human peace" which he considers an indispensable "good" for human welfare and progress. In the course of his argument he arraigns war as "an illimitable evil," a "form of waste and dissipation;" but on the principle that "the end justifies the means," to be righteously engaged in if "human good" necessary for the progress of the race can be procured in no other way.

He seeks to prove that in this and future ages war has become unnecessary, for the reason that the "master evils of life, sin, hatred, disease, ugliness, ignorance, penury," cannot be decreased, but are rather increased by war. Conversely he seeks to show that "goodness, health, beauty, knowledge and material sufficiency," as a basis for these, are the chief "human good" and cannot be in-creased by war. Hence, since the modern life depends for its success and progress upon the universal sharing of a "vast body of positive science," upon "world-wide and complex cooperation in the industrial world," upon the "rising of the mass of workers ever higher in consciousness and aims of life" nigher the consciousness and aims of life and upon all nations and races of mankind securing "a more intimate and organic re-lationship," all aims advanced by a human peace, "war is a social miscarriage."

The author makes no claim for world leadership toward a "human peace" for "traditional Catholicism." Indeed he declares that it and the Christianity of which it is a part "has worked out its own metaphysic" until it "has become exclusively the re-ligion of the next world" and the "missionligion of the next world and the mission-aries of the western world are now pro-posing to the East a religion which has ceased to be the religion of the western world." He believes, however, that it is possible to add scientific content to the "doctrine, worship, institutions, including the papacy" of the Roman Catholic church in such fashion that its inclusive system of faith and morals may become synonymous with a "many-sided, positive, human per-fection, individual and social, symbolized and inspired by the transcendent Perfection or Divinity of Christ."

Something like this is involved in the effort of Protestantism to universalize its message and reduce its sectarian divisions in the Federation of Churches of Christ. And the rederation of Churches of Christ. And the words "cosmic idealism," and "religion of a perfected humanity," and many other phrases, used by those who do not look to any form of historic Christianity for the future leadership of the race, may be held to contain a content of universal aspiration and ethical achievement so similar to the author's "scientific Catholicism" as to deprive his formula of exclusive significance. All, however, who have studied deeply the real causes and cure of war may well accept his statement that "the peace of the earth must come, if it is ever to come, from the peace of the directing human soul illum-ned by its conception of the Perfect Good." The book should be read by thoughtful students of religious and social movements as an indication of "modernism" inside as well as outside the Roman church.

IS CIVILIZATION A DISEASE?

By Stanton Coit. Houghton Mifflin Com-pany. 136 pp. Price \$1: by mail of the SURVEY \$1.06.

ANNA GARLIN SPENCER.

The magnitude of the practical tasks which call for immediate application makes us impatient just now with the chatter on progress, civilization and what not, that normally blows over the land like a gentle and soporific breeze. A man who would enthuse us over some new discovery or some new thought has to be quick about his business and express himself with the utmost

lucidity, or he will find no listeners at all.

Dr. Coit, in this essay, provides a stupendous idea in tabloid form. In brief, having discovered that the era of civilization is nearing its close—a "mere musbroom is nearing its close-a "mere musbroom growth," it is true, embracing at most onetenth of the career of man-he asks what next, and he finds the answer in the forecast of a stage essentially different from that through which we have passed these last

ten thousand years.

The remedy for the disease of civilization according to Dr. Coit, is not that proposed by Edward Carpenter and other advocates of the return to nature. Having become self conscious, man cannot return to a primitive state. Nor can we flatter ourselves that civilization is its own remedy and that all we have to do is to eradicate the remnants of barbarism. On the contrary, the new era requires an entirely different structural prin-ciple of social integration. "The world-war is perhaps best understood when it is looked upon as a struggle of civilization against its

In other words, this globe is really getting too small for it. Foreign trade as a process of private competitive pursuit must give way to world-organization of supply and distri-bution. All the new inventions are in the direction of emancipating those held in oppression by a social structure which is essentially monopolistic and based on artificial divisions of mankind. The new control over nature embraces control also over human propagation, not by government but by social agreement. East and West at last meet on a operations. See any way are as a more on a footing of equality, and the new contact of contrasting types of culture quickens intellectual and spiritual life. Religious passion for union supersedes international, industrial and doctrinal strife.

"Surely when man has gained centrality of health, he will worship the unifying will which is dominant whenever health prevails. He will adore the spirit which makes the many one."

RETIMO LASTER

COMMUNITY: A SOCIOLOGICAL STUDY By R. M. Maciver. The Macmillan Company, 437 pp. Price \$3.75; by mail of the Survey \$4.

By one of those curious coincidences which really do happen, when the book, Community, arrived for review, it was placed next to the City Worker's World, by Mrs. Simkhovitch [the SURVEY for July 28, page 367]. more happy combina-tion could have been made. Mr. Maciver

gives an extremely valuable, though somewhat abstract, analysis of the world we live in. Mrs. Simkhovitch makes no pretension to recondite theories; she simply tries to show us some of the variety and color of The two books should certainly be read together. One has the hum and interest of the streets and the tenements; the other, too much of the atmosphere of a college library.

Mr. Maciver has essayed an unusually difficult and comprehensive task. book which is thoroughly original and defi-nitely breaks new ground. We have had nitely breaks new ground. We have had theories of the state before, but few writers have given us such an examination of the various forms of association and the relation of personality to them. We needed this book badly. Of the thousands who lightly talk about "national reconstruction," how many question the issues involved? This book provides a real preparation for the

It was inevitable that, in endeavoring to give us a comprehensive view of so great a subject as this of Community, there would subject as this or Community, there would be over-emphasis in some parts and under-emphasis in others. Surely, we do not need page after page to prove that man is in-fluenced by his environment. In several places we have a detailed over-elaboration of many obvious statements; in yet others, we could have wished for a more generous treatment of the theme. The relation of treatment of the theme. The relation of voluntary associations to the state, is one topic that might well have been extended.

What would Mr. Maciver say to the recent development of power by the trades unions of Great Britain, who no longer seem willing to submit to national authority, even in the midst of a desperate war? National guilds may yet prove a serious menace to the integrity of the state. Our author is 202

usually quite convincing, but he has a severe task when he tries to demonstrate that the modern sub-division of labor serves tha modern sub-division of labor serves tha development of personality. While he urges us to "remember that the engineer often loves the engine which drives his ship, but no ancient galley-rower ever loved his oar," would it not have been a truer analogy to enquire how much affection there is between

the stoker and his shovel? Not the least valuable part of Mr. Maciver's study, is his discussion of psychologi-cal problems. It is to be hoped that as a consequence, we shall hear less nonsense in the future about "social psychology," though one might have wished that our author's handling of the psychology of personality had been vitalized and illuminated by some of Mrs. Simkhovitch's experiences.

Mr. Maciver has, nevertheless, rendered us a great service. He is clear in his defi-nition, precise in his distinctions, lucid in his analysis, and has made us all his debtors for the way in which he has performed a difficult task.

A H RUBNETT

EXCESS CONDEMNATION

By Robert Eugene Cushman. D. Appleton & Company. 323 pp. Price \$2; by mail of the SURVEY \$2.15.

There are three reasons for the practice of excess condemnation: to solve the problem of remnants of land after an improvement, for the protection of the public im-provements, and for recoupment or profit. The author advises the use of excess condemnation for the first two purposes, holding that they are important public purposes and warrant considerable expense. He advises against the practice for recoupment or profit alone, but holds that recoupment or profit may be worked out in connection with either of the other purposes.

Besides the very painstaking discussion of the three purposes mentioned, the theory, the financial gains and risks, the administration and the constitutional aspects of excess condemnation are helpfully presented. With its historical and illustrative material and general citation of cases the book will prove helpful to all students of the subject.

It will hardly solve the problem of municipal improvements, however, to take extra land to avoid irregular jogs and niches, or to protect improvements if it has to be done at an additional expense to the taxpayers. The slow movement of our cities towards fundamental improvements is primarily because of the expense involved. The volume by many be considered lacking in its handling of this. inexpedient to take all the new values creby an improvement and that anyway it is difficult to appraise them. Some im-provements add values throughout a wide area, even throughout the entire city.

This problem can be effectively and helpfully solved by taxing city property, espe-cially land, on its value for use. This is the value as which it is held and upon this is should be taxed. The author says that "from the standpoint of pure theory the city is entitled to the whole amount of such in-crease." Why not take it, wherever found, and make improvements pay their way? By so doing all necessary improvements may so doing all necessary improvements may be made, and money will always be avail-able for the purpose. This principle, es-sentially that of land values taxation, will solve many problems where excess con-demnation may not be applied, as where a sewer is constructed, or any similar improvement is made.

The volume is a valuable addition, nevertheless, to the literature on municipal problems.

EDWARD T. HARTMAN.

be

SOCIAL PROBLEMS IN PORTO RICO

By Fred K. Fleagle. D. C. Heath & Company. 139 pp. Price \$1, postpaid.

Porto Rico, an island of but 3,500 square miles area, with a population the average density of which is ten times that of the United States, and with an increase of dirths over deaths about double that of the United States, and with its wealth held by less than 15 per

cent of the population, presents social prolems that demand the serious interest of all Americans. "The pearl of the Antilles" has now been under the American flag for nearly twenty years. During this time it has attracted and charmed many tourists, has attracted and charmed many courses, yet very few among us have any clear ideas about the people, the customs and the problems of this new possession of ours. Life is not hard in the tropics, but powerty may more than offset this advantage;

thus, there is a per capita wealth of \$1,123 in the United States: in Porto Rico this is but \$182, and much less evenly distributed. "It has been estimated," says Fleagle, "that the wealth of the Island is in the hands of about 15 per cent of the population, and that the remaining 85 per cent are practically dependent upon uncertain labor and wage conditions for their maintenance." In addition, these people must contend with ignorance, debility and poverty, and have not the support of a "great middle class of financially independent farmers which constitutes the strength of the United States and

more prosperous European countries." Dean Fleagle has been in charge of the Normal School and the University of Porto Rico for the past ten years. Always keenly interested in social problems, his position has given him unusual opportunitles for has given him unusual opportunities for study and investigation. Naturally he looks to the schools to help solve the difficult problems that he presents. "The school must do its share in the teaching of small farm and garden farming, and the government should assume the responsibility for fostering the increase of the number of small farms as well as for assisting in the educational work to improve the methods of cultivation."

Social Problems in Porto Rico is short and to the point, almost to the extent of being dogmatic. It is well worth reading. S. B. GRUBBS, M. D.

INTRODUCTION TO SOCIOLOGY

By Emory S. Bogardus, Ph. D.; University of Southern California Press. 343 pp. Price \$1.50, postpaid.

This textbook grew out of the author's syllabus, An Introduction to the Social Sciences, and is intended to supplement specialized studies for professional preparation in law, medicine, engineering, etc. Without some such correlating course of study, the modern college is apt to turn out a great variety of good specialists but no good citizens

Professor Bogardus believes that sociological study should always be as concrete as possible, relating to actual experiences movements rather than refining classification to an extreme accuracy. Thus he suggests that every student be "asked to subscribe to such a magazine as the SURVEY. in which regular assignments for class discussions may be made. The magazine will assist the student in keeping alive to present-day social changes. An occasional debate may be arranged for four or six members

of the class on an apropos topic.

In a longer review, we should take excep tion to a few of the definitions contained in this volume and, in several cases, to the arrangement and presentation of the subject matter. Let it suffice here to state that the author does not, perhaps, distinguish clearly enough between the sociological and the social points of view. While the latter is concerned exclusively with the welfare of society, the former is concerned primarily with scientific inquiry; its subject matter is society, and what distinguishes it from a study of the social aspects of medicine and law is its synthetic quality.

POLITICAL IDEALS

By Bertrand Russell. New York Century Co. 172 pp. Price \$1.00; by mail of the Survey \$1.06.

In simple language, the five essays contained in this slim volume give the author's political credo, more fully developed in Why Men Fight. He avoids argument on the issues of the present war and says little with which its most ardent supporter cannot agree -provided he be a democrat and seek for a better economic and political system than

the one under which we live.

The emphasis is laid on the old, yet ever present strife between the creative and the possessive impulses in man, the former implying reverence for others and respect for the possibilities of self-development, the latter the builder of institutions and conventions which discourage individuality and hamper progress. He does not deny the value of organization on a vast scale, but shows that it must inevitably thrust power into the hands of the few and render the many without initiative, unless the govern-ment of every organization is genuinely democratic.

The reconciliation of liberty with government to him is the chief problem in economic and political relationships which must be solved before the world can be made safe and at the same time open to every form of human advancement. In statecraft, "democracy is not at all an adequate device unless it is accompanied by a very great amount of devolution." A good economic system will not only provide security against destitution or make possi-ble the largest industrial output or give distributive justice; it will do all these things, and in addition it will liberate the

Creative pulse.
Political Ideals will help the reader who sees all the ruin wrought by capitalism and the possessive motive in world politics, and yet is prevented by fear of the "servile state" from embracing the doctrines of socialism. It gives no new political system, no visionary scheme of revolutionary change, but formulates the philosophic basis for a program of immediate and consecutive re-

CODE OF ORDINANCES OF THE CITY OF NEW YORK (annotated, 1917)

By Arthur F. Cosby. Banks Law Pab-lishing Company. 568 pp. Price, \$3.50, postpa

This little reference volume gives the ordinances of New York as they are revised to the close of 1916, appotating them chiefly by references to the charter of Greater New York or to court decisions relative to the matter of a particular section. Its prac-tical value is enhanced by all the charm that India paper, good type, limp leather binding and a convenient format can bestow.

### INTER-ALLIED CONFERENCE ON CRIPPLES

A LL the allied governments with the Acception of Japan and Italy were represented at the second reunion of the permanent inter-allied committee on the re-education of war cripples recently held in London. Major Robert Osgood, U. S. Medical Reserve Corps, and Grace S. Harper, chief of the Bureau for Reeducation of Mutiles of the American Red Cross, were the official American delegates.

In addition to a number of public functions, the committee held two private sessions at which it was decided to call a general conference to be held in London next May (the first conference, held in Paris last May, was reviewed in the SURVEY for September 29), and to work for the immediate establishment of an inter-allied institute in Paris. This institute, for the maintenance of which the various governments will be asked to make appropriations, will centralize information on work done in the different countries and distribute it by means of a periodical bulletin. A museum for exhibition of apparatus and work done by re-educated soldiers and a comprehensive library are also planned for.

Among the institutions visited by the committee were hospitals, training schools and industrial establishments. At Brighton they saw disabled soldiers working on diamond cutting and polishing. This is a new industry for war cripples, and a factory for their accommodation is under construction. In the case of poultry-raising, soldiers' wives are given a course likewise, so as to make possible a suitable division of labor in the home.

The following brief sketch is given the SURVEY by Miss Harper of the stages through which the disabled English soldier passes on his return to civil life. It will be seen that in certain points the system differs from the Canadian described by Douglas C. McMurtrie in the SURVEY for November 3:

After receiving treatment, medical or surgical, in the military hospitals, he is evac-

usted to an orthopedic center, where he receives reparative surgical treatment if necessary, also physiotherapy and what is termed "curative" work. When ready for discharge, if in need of artificial limbs, be is sent to Rochampton or to another similar institution where limbs are manufactured and adjusted and where he is taught to walk.

During this period of waiting for fattings, etc., technical trisining is given in well-caujuped workshops. Instructors are supplied here, whereas in the "curative" shops teaching is left to the chance of finding a disabled man with knowledge of the trade among the patients themselves.

Before discharge from the army, each man panes a medical examination, and his pension in determined on the basis of degree of disability. If further surgical or medical treatment is necessary, arrangements for this are made in the locality where the man lives, are made in the locality where the man lives, due to by one-half. Before discharge, all date concerning him are forwarded to a local committee in the district from which he comes. This committee at once takes up the question of his industrial re-education and employment. When a pension does not militee sends reasons for recommending a change to the Ministry of Pensions.

Arrangements are made for professional re-education either in factories, workshops or technical schools. If unable to live at home while undergoing training, the pensioned is allowed lodging and maintenance. The local committees find employment when training is completed. They function under a general supervisory committee, which is now a part of the pensions ministry. All its voluntary; they are composed of representatives of labor, industrial concerns, the medical profession and others.

# LEARNING BY EARNING IN THE STREET TRADES

HICAGO has been finding out something about the mysterious merchants of her curb stones, her boys in street trades. Though these urchins are more in evidence in most cities than any other variety of vendors, they have remained inscrutable conundrums in respect to the details of their working lives, their school histories, their use of money and leisure and the precier net effect of good or bad which their occupations have upon their futures.

Anna Y. Reed reported recently (the SURVEY for November 10, page 149) that the newsboys of Seattle had better records of school attendance than other boys, but partially explained this by the careful methods of employment in that city. Educators are urged to wait for further data before adopting newsselling as a vocational adjunct to the school room.

Chicago has a different story to tell. School work, far below grade; poor scholarship, even in the low grade attained; truancy and irregular attendance—these are some of the conditions that characterize the "pitiful school histories" of her children in street trades. These children seem also to be "handicapped in their future earning power, not only by lagging behind their little competitors in school, but by the physical strain of their trades.

In the last two years 660 boys and girls engaged in street trades have been investigated by the Chicago Juvenile Protective Association. Close inquiry into the need of the child's earnings by the family was made in 300 cases chosen at random. Only 19 per cent showed such need. Not even in these cases could the child's earnings "possibly constitute a practical solution of his family's powerry."

It is with respect to the association of street-trading with begging, thieving and law-breaking that the report is most detailed. "In the 660 cases mentioned," it says, "the element of begging or of some form of trickery either in selling

203

or in the evasion of the law was so frequently and subtly associated with the occupation that no attempt at separate analysis is practicable." Some children were encouraged by their parents to exploit their physical deformities or weak physique as a means of getting tips or of increasing their sales.

Among the newsboys who congregated after 6 P. M. at two large distributing centers for newspapers indecent stories prevailed, especially in relation to sex perversions, and "numbers of unproven and apparently unprovable instances of criminal practices" came to the knowledge of the investigator. While they were sleeping, boys were robbed of their money and clothes by other newsboys. Gambling was a regular practice, mainly shooting craps and playing seven-up. On one occasion the stakes, usually small sums of money, were the age and school certificates which had enabled the boys to go to work.

The street-trading regulations in Chicago are not strict. They permit boys from ten to sixteen years of age to work between 5 A. M. and 8 P. M. Over half the year it is dark at 6 P. M. in Chicago. Boys of eight were found engaged in these occupations, some of whom worked ten hours on Saturdays. Patrolmen did not always assist in enforcing the law. One officer's attention was called to a boy tending stand in violation of the ordinance. "Let him go," said the officer. "He is well dressed and lives in a good neighborhood; his family is taking care of him." Another officer's attention was called to a lad of nine. "Let him go," he said. "His clothes are ragged, and he lives in a poor neighborhood; he is helping to take care of his family."

On the whole, however, police department, juvenile court, newspaper managers and others have cooperated in improving conditions. Congregation at the two distributing centers referred to has been done away with and 139 boys have been rescued from the demoralizing influences of these places. The city ordinance still needs strengthening, the Juvenile Protective Association believes. Moreover, it declares that there are means of "preventing vagabondage and juvenile delinquency" that fall outside the scope of police power and should be undertaken by some other agency in the community. More and better recreation is one of these.

In the last two years the Chicago Woman's Aid has maintained a director of recreation for the hours succeeding the regular school session in a school in one of the most congested parts of the city. This provision was extended early in 1917 to another school by the Jochannah Lodge. This concrete practical experiment, says the association, should be repeated throughout the city.

Furthermore, Chicago should create

the office of director of recreation, already existing in many cities. Such a director would coordinate the facilities of existing agencies, encourage athletics by matching teams and obtaining fields and gymnasiums for games, agitate for desirable recreational agencies in sections of the city where there are none and, finally, help boys and girls in every region of the city to connect themselves with constructive recreation and "above all to secure the use of the public schools for that purpose."

# THE GREAT UNKNOWN IN PARTY POLITICS

HE reason why speculation runs so high concerning the probable effects on party politics of the recent enfranchisement of some three million women in the state of New York is that the great majority of them are expected to vote in their capacity as consumers. Consumers as such have hitherto remained unrepresented. Now the news comes that, without waiting for the enfranchisement of women, the three and a half million men and women in Great Britain who are members of the consumers' cooperative societies have formed a political party for the express purpose of distinctive representation in Parliament.

At a national conference held at Westminster in October, the new policy was inaugurated; it signifies a revolutionary departure from the past principles of the movement. It was decided that "he neglect of consumers' interests, in spite of occasional and partial protection by the Labor Party, which primarily represents producers, on the part of the government and of Parliament, had become intolerable. New taxes have been imposed, intricate machinery for the control of food and transportation been created. the personal relationships of the individual to the state been placed upon an entirely new basis without any consideration of the large interests involved in the cooperative organizations of the country.

This neglect, of course, is due to the traditional apathy of the cooperative leaders to direct political action and to participation in administrative responsibilities. But for some time there had been signs that the rank and file was determined to seek a close political affiliation with the Labor Party, most nearly related of existing parties to the cooperative movement in general aims and outlook. And more lately the clamor for independent national and local representation on a cooperative ticket gained a great majority.

The conservative elements in the movement, however, those who by decades of patient, painstaking effort have built it up on an unassailably sound basis of business efficiency, succeeded in preventing a headlong plunge into polit-

ical experimentation. The scheme finally approved by the conference to be put immediately into operation, provides only for a minimum initial party fund of about \$35,000 to be made up from a minimum subscription by retail distributive societies of ten dollars per thousand members. In addition to a central committee, representative of all cooperative organizations, each constituency is to have a parliamentary council of local societies. Their relation to the central executive will be very similar to that of political clubs to any party organiza-

Almost simultaneously, great changes are also taking place in the constitution of the British Labor Party which in future will admit to membership individuals as well as trade unions and Socialist organizations and which, by thus enrolling many "intellectuals" and other sympathizers who hitherto have been driven into one of the older parties, will become more liberal in its interpretation of the political needs of labor. Although none of the proposals to this effect was adopted, it is significant that at the recent party conference a change of name to "democratic" or "people's" party was seriously considered.

If they succeed in working with the cooperators, many of whom are hostile both to Socialism and to the syndicalist pretensions of certain sections of organized labor, the reconstructed Labor Party may soon play an overwhelmingly important part not only in British but in international politics. "The evolu-tion of such a party," says the New Statesman, "pledged to the program passed at the [cooperative] conference, would revolutionize not only the movement itself, but the whole of party politics." This journal, though it enumerates the difficulties in the way of a very close affiliation between the forces of organized labor and organized consumers, foresees the possibility that Arthur Henderson, chairman of the Labor Party, to whose statesmanship the reconstruction of that party is largely due, may before long find himself entrusted with the responsibility of forming a government.

#### LIBERTY IS ALL OF ONE PIECE

HE government has recognized this solemnest of all facts, that it will do no good to send our sons to France to fight for our political rights if, while they are doing that, we surrender our social and industrial rights. Liberty is all of one piece."

These few words from the address of Newton D. Baker, secretary of war and president of the National Consumers' League, at its eighteenth annual meeting in Baltimore last week, condense his ideal of the relation of the nation to its working citizens and his policy in dealing with labor. They put in a nutshell also a hint of the new undertakings which the league, with his approval, has been adding to its former firmly established work.

Recognizing the need of labor standards to guarantee to the wage-earners life, liberty and the pursuit of happiness, Secretary Baker has effectively striven to retrieve the manufacture of army clothing. This has been, in both England and America, traditionally the greatest area of the sweated trades.

For the Board of Control of Labor Standards administratively created by the secretary of war on August 24, Mrs. Florence Kelley, who serves as secretary both of the board and of the league, could, after eighty days of its existence, report the following steps thus far

New York city as a center of manufacture of one-half of all uniforms for private soldiers, offered at once the largest and most challenging field of operation of the new board.

In September, by the first effective order of the quartermaster-general, issued at the urgent request of the Board of Control, all privates' uniforms were withdrawn from the tenements to which they had been sent by contractors for hand-finishing. On so great a scale had this work been done that a single firm, by no means the largest in the trade, now found it worth while to rent for \$9,000 an additional loft which it equipped with machinery to replace the handwork thus abolished. To civilians not in the government service, it is a startling circumstance that the necessary machines had been on the market for twenty years, but specifications inherited from a civil war requiring hand work in the finishing process had made it impossible to use them

In October, fire hazard, the perennial menace threatening the lives of New York city workers, began to diminish in the uniform trade. Before a contract can be let, it must first be approved by the board and tenders of prospective contractors are now promptly forwarded by the depot quartermasters through the Board of Control for scrutiny of the premises which each contractor proposes to occupy. Thanks to the cooperative work of the New York city Bureau of Fire Prevention under Joseph Hammitt, the board has found it possible to approve or disapprove on grounds of safety or of fire risk the proposed contract without delaying the flow of uniforms towards the camps and the trenches. Unfortunately, for lack of similar bureaus in other cities, no such achievement will be possible in Philadelphia, St. Louis or other centers of this branch of the garment trades.

In November, with the approval of Secretary Baker, a contract takes effect between the War Department and its

# Our Christmas Handkerchiefs Are Ready

•

All our Christmas Handkerchiefs from foreign lands are here and already our thoughtful patrons are making their selections while the stocks are full and before the

mind Christmas rush begins. It is so much more satisfactory to shop for Christmas in November.

Once more we exhibit a variety of styles that run far into the thousands. The collection is just as large as usual—plain ones, elaborate ones, hard-service kinds and filmy Cobwebs; large square ones and dainty glove Handkerchiefs for Men, Women and Children; and every Handkerchief is pure Linen, as always at "The Linen Store."

The Irish and Swiss have provided the moderate-priced Embroidery.

The *Madeira* workers have sent their own peculiar Eyelet-Embroidery and scalloped edges on sheer Linen.

We pack them in the dainty White boxes with the little Gold Spinningwheel on the cover, which is to Linen what "sterling" is to silver.

Orders by mail given special attention. Send for latest Catalogue.

### Help Win the War!

Food is one of the vital factors. If you want to be patriotic, have at least one meatless day and one wheatless day each week.

# James McCutcheon & Co.

Fifth Avenue, 34th and 33d Streets, New York

clothing contractors which differs from all previous contracts in the guarantees afforded for reasonable working hours and a living wage for even the humblest employes of the smallest subcontractors. In future it will be the duty of the Board of Control to cancel the final payment for work done up to 10 per cent of the value of the whole contract, if any subcontractor has, in its execution, defrauded any man, woman, youth or child in his shop. And the right of the workers to be heard through their representative—who need not be an employe—is

established for this trade for the first time in American history. This is an application, by the nation itself, of the principles which the Consumers' League, during a quarter of a century, has patiently urged.

By an interesting coincidence, this anmust meeting fell upon the tenth anniversary of the league's entrance upon a task new for itself and for American jurisprudence, the defense of the Oregon ten-hour law for women. Following a ten years' exposition of the relation of health to labor legislation, the league

# "America's First Word on Reconstruction"

# RE-EDUCATION

An Analysis of the Institutional System of the United States
By George Edward Barton

In a very real sense this is "the book of the hour."
For in it is formulated a plan whereby disabled soldiers may be made almost, or wholly self-supporting, thus lifting what may become an almost unbearable burden from the shoulders alike of the taxpayer and philanthropist.

The author who writes from personal experience as well as from prolonged investigation, is director of Consolation House and President of the National Society for the Promotion of Occupational Therapy. His book is of particular interest to social workers from the fact that his plan is equally fitted to the needs of inmates of asylums, hospitals, prisons and other public charges. \$1.00 Net.

# SITUATIONS WANTED

COLLEGE WOMAN, experienced in institutional work desires position as superintendent either in children's home, or for aged people. Address 2655 SURVEY. now broadens its field. In response to the unprecedented sudden spread of war industries, a Committee for the Study and Safeguarding of Health in these dangerous trades has been created with Dr. David L. Edsall of the Harvard Medical School as chairman and Dr. Alice Hamilton one of its most active members.

The re-election of Secretary Baker for a third term as president of the National Consumers' League gives an impetus to the activities of state and local leagues in fifteen states and the District of Columbia.

## JURY OF SCIENTISTS HUNG ON STERILIZATION

HAT scientific thought is not growing more favorable toward the sterilization of criminals, which has won legislative support in at least two states, is indicated by the report of Committee "F" of the American Institute of Criminal Law and Criminology, published in the November number of the Journal of that body. This committee was disbanded upon its own recommendation. It was composed of eleven membersfour physicians, at least two students of eugenics, one judge, one probation officer and others variously familiar with the questions involved. Its request for dismissal was based upon the belief that there was no use to write further opinions until "scientific, statistical and social work" had provided a sufficient basis of facts upon which to erect a judgment.

The committee describes the complexities of the problem as very great, involving "questions of heredity, of surgery, of law, of morals, religion and sociology, about which divers views are

held, not only by people in general, but by the members of the committee in particular." One member found in California and Indiana, the two states referred to, a "general reluctance on the part of the responsible officials to proceed under the law," Several members, including the chairman, Dr. William W. White, Government Hospital for the Insane, Washington, D. C., do not "believe in inherited criminality as a trait." In general, this represents the view of eugenics specialists on the committee, though one of these, while saying that "criminality as a unit trait is not inherited," believes that certain factors that go to make anti-social individuals are inherited, such as wanderlust, specific types of feeblemindedness, lack of sex-control and the lack of other moral inhibitions.

One member, Dr. T. D. Crothers, of Hartford, Conn., is very much in favor of sterilization, while another, Dr. William T. Belfield, of Chicago, submits a somewhat caustic minority report. After pointing out that the majority report establishes first that "the views held by various members of the committee concerning religion, morals and other topics" prevent them from uniting upon any common ground as to the merits of sterilization of criminals, and then deduces from this that there is no further necessity for the committee's continuance, Dr. Belfield goes on to suggest, as the more logical deduction from the premise, that "the present members of the committee-a jury unable to agree upon a verdict-be replaced by men whose views on other topics do not incapacitate them for the study of a problem in public welfare."

Taking all the facts into consideration, the committee concluded that "no common ground of agreement which will be of value can be reached unless definite research work can be carried out upon a considerable scale." This it did not regard as its proper function. It was, therefore, disbanded.

# REAL ESTATE AND HEALTH APPROPRIATIONS

A LIVELY contest is on regarding the appropriation by the Board of Estimate and Apportionment of New York city of over \$63,000 to extend the work of industrial hygiene of the Department of Health. On November 19, representatives of real estate interests appeared before the Board of Aldermen, who have the final decision in the matter, and opposed or supported it vigorously. The board have deferred decision for fifteen days.

"Rather than appropriate \$60,000 for this work," said one speaker, "the real estate owners, if I interpret them aright, would spend a million dollars to stop it." This was, perhaps, the most extreme expression of opposition. Questions from several aldermen showed both sympathy and informed interest in industrial hygiene. Stewart Brown, of the Real Estate Owners' Association, who had opposed the appropriation at earlier hearings, expressed himself now as in favor of it. He believed that frequently movements such as this were not clearly understood by manufacturers, who hastily classed them as "uplift" schemes and opposed them as sentimental. When evidence of the practical advantage of these plans was more clearly seen, there would be less hesitation, he felt.

The Division of Industrial Hygiene asked for the amount in order that needed inspectors, sanitary and medical, might be added to its force. On several occasions during October, members of the Labor Sanitation Conference (the SURVEY for April 14 and June 30) appeared before the Board of Estimate to urge that the sum be immediately appropriated. The conference, whose membership represents fully 600,000 employes, are actively supporting the Health Department in this work, considering it is a practical measure for conservation of life and efficiency.

### THE MASSES STAFF UNDER ARREST

THE most far-reaching attempt yet made by federal authorities to enforce the espionage act was made on Monday when indictments were handed down by a federal grand jury in New York city charging Max Eastman, editor of the Masses, a Socialist monthly. and six other members of the staff and contributors with having conspired, while the country was at war, to cause, or to attempt to cause, "insubordination, disloyalty, mutiny and refusal of duty in the military and naval forces of the United States.

In addition, two indictments were returned against the Masses Publishing Company and C. Merrill Rogers, Jr., its business manager, for having "unlawfully, wilfully, knowingly and feloniously" attempted to use the mails for the transmission of matter declared to be unmailable.

Several of the persons indicted are well known in the literary world. Following is the summary of their alleged offenses as published in the New York Times:

EASTMAN, MAX, it is charged, between June 15, and 19, 1917, wrote and caused to be published in the August issue of the magazine an article entitled A Question.

DELL FLOYD, accused of the same offense in relation to an article entitled Conscientious Objectors.

REED, JOHN, accused of having written and published an article called Knit a Straightjacket for Your Soldier Boy. BELL, JOSEPHINE, accused of having writ-

ten and caused to be published in the

August issue of the Masses a poem called A Tribute.

GLINTENKAMP, HENRY J., accused of having drawn for the October issue of the magazine a picture representing a skeleton symbolizing death, taking the measurements of a drafted soldier for his coffin.

YOUNG, ARTHUR, an artist, charged with having drawn a picture entitled Hav-ing Their Fling, which was reproduced in the September issue of the Masses.

Articles, poems, cartoons and pictures published in the magazine, it is alleged, were "calculated and intended to induce persons liable to military service to refuse to submit to registration and draft for service and to induce persons available and eligible for enlistment and recruiting to fail and refuse to enlist for service therein."

Earl B. Barnes, government prosecutor, asked that bail be fixed at \$20,000 for Mr. Eastman and at \$10,000 for each of the others. On Tuesday Judge Julius M. Mayer, United States District Judge, southern district of New York, fixed bail for Miss Bell at \$1,000 and on Wednesday that of four others as follows: Mr. Eastman, \$5,000; Mr. Rogers, \$3,000; Mr. Young, \$1,000; Mr. Dell, \$500. These amounts were promptly paid and the accused persons were paroled until Friday afternoon in the custody of Morris Hillquit, their attorney and recent Socialist candidate for mayor of New York city. It is expected that on Friday they will either plead not guilty or demur to the indictment.

The maximum penalty for the offense charged is twenty years' imprisonment and an additional fine of \$10,000.

Some weeks ago the Masses was denied the use of the mails by a federal court, which reversed a decision in their favor by a lower court, and subsequently newsstand dealers refused to handle the magazine on the ground that to do so would make them liable to be charged with violating the espionage act.

In September Mr. Eastman wrote to President Wilson a letter in which he denied that his magazine was part of an organized propaganda to encourage resistance to the draft,

Smarres

If you know the name of the agency or organization, turn direct to the list-ings (3d column) for address, corre-sponding officer, etc. [They are ar-ranged alphabetically.]

If you seek an unknown source of information, turn to the subject index, following. The initialings correspond to capital letters in names of agencies.

If you count to know the agencies.

If you count to know the agencies
at work in any great field of social
concern, turn also to this index. [They
are grouped under major subject classifications, as "HEALTH," printed in
conitals.] capitals.]

Correspondence is invited by the agencies listed; questions answered (enclose postage for reply) and pamphlets supplied free or at nominal charges. Membership is not required charges. Membership is not required of those seeking information, but offers an opportunity for you to share spiritedly and seriously in your community or profession in an organized movement which is grappling with some country-wide need or cause.

If you are uncertain where to turn address the SURVEY, and we shall endeavor to get your inquiry into the right hands.

### WARTIME SERVICE

"H OW the SURVEY can serve" II was the subject of an inforour library, to which we asked the executives of perhaps twenty national social service organizations. The conference was a unit in feeling that as a link between organized efforts, as a link between organized efforts, as a means for letting people throughout the country know promptly of needs and national programs—how, when and where they can count locally—the SUNVEY was at the threshold of an opportunity for service such as has seldom come to an educational enter-

The development of this directory is one of several steps in carrying out this commission. The executives of these organizations will answer que-tions or offer counsel to individuals and local organizations in adjusting their work to emergent wartime de-mands. mands.

AUL U. KELLOGG, editor of the SURVEY, has gone to France to be eyes and ears for those of us who must stay at home at our more humdrum tasks. He will report for SURVEY readers on the greatest task of social reconstruction ever undertaken. The first of his articles pears in this issue. That, and the three next succeeding, will deal with the organization and work of the American Red Cross overseas. Later will follow descriptive and interpretive articles on other subjects and other agencies.

IT is a marvelous story. "Somewhere in France" to-day, from everywhere in our United States, are men and women who have brought to monstrous problems of relief and reconstruction the experience hard-won in settlement, school and clinic, in charity organization, in city planning, in housing reform. They have come from east and west, north and south, to help French comrades shoulder the task of mending a broken country-side and a shattered populace. They will put to test in a strange land and under unheard of difficulties the old, tried methods of case work, medical treatment, child welfare and city planning.

The building up of a system of home-finding for children of New York state, of care for the aged and leadership in the flight against tuberculosis, have equipped Homer Folks to organize the care for the children, the sick and the homeless of France from his office of director of Red Cross civilian relief in Paris. Such disasters as the San Francisco earthquake and the Ohio and Mississippi floods have given Edward T. Devine the resourcefulness and understanding to cope with this greatest of human catastrophes in Europe, to plan wisely and sympathetically for the refugees, who are placed under his charge. Ernest P. Bicknell, for many years head of the Chicago charities and chief executive of the Red Cross at Washington, is at the head of Red Cross relief for Belgium.

Associated with them are Dr. William Charles White, of Pittsburgh; Dr. James Alexander Miller, of New York, and Dr. Livingston Farrand, of Boulder, Col., leaders in the movement for the prevention of tuberculosis; George B. Ford, the city planner and builder of workingmen's homes; Dr. William Palmer Lucas, the pediatrist of the University of California; Dr. Selskar M. Gunn, secretary of the American Pub.

lic Health Association; Margaret Curtis of the Boston Associated Charities; Grace Harper of the Social Service Department of the Massachusetts General Hospital; F. Elisabeth Crowell of New York Association of Tuberculosis Cilinics; Elizabeth Ashe, head resident of Neighborhood House, San Francisco.

These are but the pioneers. Every week recruits arrive in Paris to report to the Red Cross or to the Y. M. C. A.—the pick of our surgeons and nurses, Y. M. C. A. secretaries, recreation men, Quaker reconstruction workers, chaplains, charity visitors, placing-out agents, architects, Y. W. C. A. hostesses singers, canteen salesmen. The purpose of all this work is two-fold: to convince the French people that America is standing shoulder to shoulder in the effort to keep French homes warm, nourished and well against odds such as few people have ever faced, no less than in the battles of the trenches; and to help a sister republic conserve its human resources for the future. Truly the energy, the efficiency, the idealism of American social service have slipped out of all bounds.

NEVER was there such a war as this before; and never was there such an undertaking as this before. The SURVEY's interpretation of it will be full and illuminating. Moreover, while Mr. Kellogg is unfolding this story of social work and social workers transplanted to foreign soil, unusually interesting articles on affairs here at home will appear in the SURVEY, for all social service has been quickened by the terrific impact of a war which calls every man and woman to some sort of action.

This is a war fought by social and industrial forces and this is the year to read the magazine whose special function is to follow and interpret and, so far as may be, help to guide those forces.

# The Development Of An Idea of Women—By Women—For You

Last December, New York discovered The Womans Bookshop. A modern kind of place as restful as your own den-with the sort of fireplace you hear about but seldom see-and chairs that make you oblivious of time! Here New Yorkers lounged and read and planned their Christmas giving. Here we invite you to come-today, any day, every day, if you wish. Look over our complete assortment of carefully selected books. Talk with our trained people who know just what you ought to send to "somewhere in France"-and what you should give to a friend over here. See how "different" greeting cards can be. See the delightfully out-of-the-ordinary gifts from Iona, Italy and India. If you are not in town, let the Book Service Department interpret your needs intelligently and satisfactorily. By all means drop in at the Bookshop. It's at 600 Lexington Avenue, at 52nd Street. Your visit will be doubly enjoyable for the evidence it will give you of part of an idea carried to success-by women.

# And Then-

The Womans Press! The second part of the idea! Upstairs, above the Bookshop, is the fully established publishing house conceived by women, conducted by women, financed by women, and to a large extent specializing in books by women. The Womans Press conceives its field to be publications bearing on the woman movement from many angles, principally from the point of view of girls and younger women. To this end, it will issue books bearing on girl and woman psychology, occupations, religion, health and kindred topics—political, social, economic—and of course, books of fiction and poetry. The first book published by The Womans Press is

# Christ In The Poetry of Today

An anthology of modern American Verse by Martha Foote Crow

A year ago The Womans Press was an idea. Today it is an established, going concern. Survey readers will welcome it, and we feel, will welcome the kind of books it will publish. Therefore, we invite your interest, your correspondence and your suggestions. We will be glad to inform you of our new publications and plans, if you will write us expressing your willingness to receive such announcements.

The Womans Press has particularly significant information of interest to authors and to the trade.

# Physicians, Public Health and Social Workers

of the

# United States and Canada

THE METROPOLITAN LIFE INSURANCE COMPANY invites physicians, public health and social workers to make use of its valuable collection of mortality statistics.

These statistics relate to the principal causes of death among white and colored wage earners in the United States and Canada. The material covers over ten million individuals for each of the six years, 1911 to 1916. Death rates are available for each race, sex, and by age period.

The Company hopes in this way to aid in the study of disease and disability among wage eamers. It desires to stimulate medical investigation and research. By offering these statistics to the medical profession and to public health and social workers, the Company expresses also its appreciation of the co-operation which it has received from physicians and others who have replied to inquiries and have given detailed information in thousands of cases. This assistance has helped to make the statistics more accurate and valuable.

All inquiries should be addressed to

# Unto Us a Child Is Born

By Charles Wagner

FROM AN ADDRESS DELIVERED AT THE SORBONNE, TRANSLATED BY LAWRENCE A. AVERILL, EDITOR OF THE
AMERICAN JOURNAL OF SCHOOL HYGIEMS.

HE future of France is necessarily in the keeping of those who at present are young in years and untried in experience. It is true, as a nation France has many problems today not a few of which at this time appear well nigh insoluble. Yet, I deem it not extravagant to assert that her greatest immediate problem is centered about her indiden—greatest because most intimately bound up with the future, immediate because in the name of the future it must be presently attacked. . . . .

France today has no hope save that represented by and embodied in French childhood. Bound up irretrievably with, its destiny is the whole destiny of this noble land which, though now invaded, insulted, calumnied, shall surely rise from out its ruins and once more move upward. In our confused national groping for light and direction, we must inevitably seize upon the child as the beacon light which points to us the way of escape from this disconcerting recoil of civilization—for it can only be through him that we may build and secure the future. To the interests of child development, welfare and protection, therefore, every other interest and every other ambition must be subordinated.

From this there springs a dual obligation—the one social, the other individual. Each is incumbent upon us not only as a sacred trust handed down from the past, but, in a larger sense perhaps, a duty which we owe to the future, to those yet unborn. No categorical imperative can be more positive, more compelling, more binding upon man and woman alike than is that which is rooted in the welfare of the child in this epoch of devolution.

To make brief mention, first, of the social duty. One often remarks the inconsistency of our French attitude which is always very favorable towards whatever concerns the individual child and yet so indifferent in matters which pertain to children as social beings or members of the group. We appear not yet to have reached that plane in our educational thinking where we can lay the foundations for a social consciousness, at least so far as childhood is concerned. . . . Whenever childhood suffers in consequence of parental vice and depravity, or of some such social goal alcoholism, or as the result of any other excess, we do not tend to be deeply moved as a people. The Frenchman seems imbued with that

spirit of indifference which, regardless of his individual appreciation of good health, clean environment and pure living as such, almost utterly disregards those qualities as essentials in the social evolution of the child.

Closely related to this duty of safeguarding the environment as a factor in the development of the child is the attitude which we assume toward womanhood—toward her in whose keeping is entrusted the sacred torch of life. In protecting French motherhood, we also protect French childhood. What kind of offspring are we to expect, for example, if during the period of pregnancy the mother has been overworked, porty nourished and perchance ill lodged? Our whole French society must be brought to feel a new interest in and a deeper and more active solicitude for the economic and social condition of woman; maternity itself must be more favorably conditioned.

In every conceivable way we must strive to solidify and enhance our family life. We must set to it that whoever assumes the responsibility of rearing children shall not only occupy a more exalted place in the public opinion but also, if need be, is better recompensed by society in dollars and cents. A country where those who fulfill this sacred duty of parentage live under less favorable conditions than those who neglect it, is a country with a confused and overturned social consciousness.

Let us for a moment look at our personal obligation as individuals to childhood. Every Frenchman is the hereditary bearer of a title to nobility that is grander than any rank to be found in the old orders of heraldry or the ancient charters of state; I refer to our personal honor and integrity. The sacred torch we have received from our forebears it is incumbent on us to transmit undimmed and in full flame to those who shall come after us.

Montaigne was a keen moralist, yet he made a grievous error when he fathered the sentiment, "II I play the fool it is upon my own head and at my own peril." By no means! In this age, when we are slowly brought to an understanding and appreciation of the laws of heredity and of the consequences of a man's acts for his family and, through it, for society as a whole, we are minded to contradict that pernicious philosophy which asserts or even implies that the profligate is the sole victim of his way of living. It is only rarely that one plays the fool save at the expense of the immediate society in which he moves, of the social edifice of which he is a unit and which is thereby rendered less sound.

No one would deny that of all our criminals the traitor to his country is the most contemptible; but the man who is incontinent, who has lost his self-respect and forfeited that of the group—he is such a traitor! For, he has deprived his country of an essential element of inestimable value to its continued integrity and well-being, namely its own honor as vested in and entrusted to the keeping of those individuals who make it up. . . If I were able at the eventide of my

life to depart hence in the assurance that I had been one of those who aided in restoring and fortifying the cult of the hearthstone and of true affection, I should fall asleep content that I had spent neither my strength nor my time in

Ages since, in the progress of civilization, man would have fallen by the wayside in his despire, his privation, his suffering, had he not constantly been encouraged and inspired in his upward trend by the awakening and unfolding of new life in the child, had not, in a word, the divine plan reincarnated man from generation to generation in those fresh, blessed beings who in themselves were emblems of a hope as lofty and so omnipresent as the eternal stars above. Has there ever been a time in our whole national history when there was more universal need of renewing our faith in life and its responsibilities than at the present moment? Surely not. If we represent the Saviour of the world as a little child, we shall not be deceived, inasmuch as the great saviour, the great healer, the great consoler, the great resource after the straggle and the horror—will indeed be the child.

# THE RED CROSS CHRISTMAS SEAL

By Theodosia Garrison

Written for the Seal Campaign in Minneapolis

O H, happy folk, contented folk, and ye that go with gold To seek within the noisy mart the gifts to mark the day Jolly toys and gems and lace and trinkets manifold Here be better wares to buy along the crowded way.

Buy a pair of red cheeks to give a little lad again, Buy a pallid woman's face the bright eyes of health, Buy a broken man a hope, buy the strength he had again, Here are baraains wonderful awaiting on your wealth.

Oh, happy folk and careless folk, the world's bazar is piled With lovely gifts and lasting gifts to mark a holiday. You who seek the fairest thing for lover, friend and child, Surely ye shall pause awhile and buy the while ye stay.

Buy a mother back her bairn, buy a man his wife again, Buy a lad the right to love, a child the right to play, Buy the wistful kindred all, home and health and life again, And God be with you gentlefolk who purchase these today.

# Four Months in France

# An Interpretation of the American Red Cross II. Work for Civilians

By Paul U. Kellogg

Paris, October 15.

ORK for civilians is a departure from old Red
Cross lines. The extensive operations of the
British Red Cross range over three continents
accessory to the army medical service. In forging American
war relief in France into an organized system of new calibre,
the American Red Cross is expanding that distinctive internal
development of the Red Cross in the United States by which
it has become the national agency through which relief and
rehabilitation are carried on in times of great natural disaster
such as floods and earthquakes.

The Civil Affairs Department took shape at the end of July. It has drawn on existing war relief agencies in France and Belgium and social work in America for executives of special training as chiefs of its several bureaus. By swift strokes it has sought to help meet emergencies as they arose, and by laying long plans it has striven to contribute some elements of experience that will be serviceable in conserving and reconstructing the social life of the future.

At the outset, the problem was resolved into its human terms: into the crippled, mutilies and tuberculous reformers, wastages of war; into the vast congregation of homeless folk, refugies from the front, évacués from the war zone, rapatriés streaming into France through Switzerland; and into the children of the nation, whose fortunes are bound up not only with all these groups but with practically every family in France, for the able-bodied breadwinners are at the service of the state and on the day they were called to the colors their earning power stopped.

A grant of 5,000,000 francs for relief has been made by the American Red Cross to the French government; one million francs has been put in the hands of General Petain and the rest will be distributed through the local government agencies. But with 5,000,000 men involved, even a sum like \$100,000,000 would amount to very little if distributed broadcast. There should be no mistake. The great burden of care for her war-stricken population has been met by France and will be so met in the future. The common soldier in the French armies-simple soldat-is paid no more than twenty-five centimes (five cents) a day, but by means of allocations of 1.50 francs a day for wife, mother or widow, 1.25 francs for children over sixteen and one franc for those under sixteen; by allocation des réfugiés to réfugié families of 1.50 trancs for adults and seventy-five centimes for children; by graded pensions for the disabled; by extensive undertakings of public relief and uncounted private charities. France is carrying this burden along with that other great burden-the cost of her fighting.

The question before the American Red Cross in its overease civilian work has been how to fit its resources into this national scheme of self-help, to do things which the French are too pressed to attempt and to work in ways which would be quickly understood as kin to their own wishes and at the same time, in view of the tonnage shortage, to set going plans calling for the initiative and free energy of a large scale organization rather than for gross shipments of material relief.

We have taken thirty years in America to learn how dynamic a thing is the public's concern for health. Here are certain submerged families. We attack their problems on a basis of charity, or of education, or of health, and find ourselves dealing with the same facts in each case—with puor surroundings, poor food, insufficient income, disease; such facts as in staggering bulk made up the war-time need of civilian France. American social workers have found how often the line of least resistance, of quickest suppreciation, is that of concern for health. It is a leverage for better houses, better food, clothes, care. The general welfare is at stake and everybody recognizes it and is willing to act accordingly.

It was the belief of the director of the Department of Civil Affairs, Homer Folks, for twenty years past a leader in charitable, educational and health movements in New York state, that this principle which America has learned to employ so slowly could be swung into full force here in France. With a stationary population before the war and a million and more dead or incapacitated by the war, with the birth-rate reduced one-third and the already high tuberculosis-rate accelerated by the war, with the future national strength and vitality at stake, every Frenchman recognizes that anything that conserves life is supremely in order.

### The Precocious New Allies

THREE other considerations fortified these American social workers in their plan of campaign. First, they reasoned, there is the new attitude in France toward Americans. We are expected, as they saw it, not only to count in a military way, but to help out all along the line. We have the money and the men, and France has long borne the heavy end of the load. The French are, very likely, a little amused at us, as they were a little amused at Franklin a century ago and tolerant of his differences. They feel that the American nation is interesting, overgrown, precocious, but that we can be useful and mean to be useful. And the fact that we are allies in a common struggle, makes it possible for them to have us here. playing our part as one of the household. Under the sanction of the war, ordinary inhibitions of peace-time do not interfere. The very human spirit of tolerance and fraternity with which France is meeting half-way these busy, uninvited outsiders in her home affairs is one of the most striking things in the whole situation. It is held a thing to cherish and not to abuse.

In the second place, under her centralized government, France will be in a position to carry out on a national scale any health program the efficiency of which is demonstrated locally.

In the third place, the Rockefeller Foundation had embarked on a permanent and unprecedented tuberculosis campaign in France, with which it was possible for the American

Red Cross to effect the closest working arrangements,

Broadly, the tuberculosis work falls into two fields:

A. A long-range educational campaign among doctors, nuses and the general public together with the multiplication of dispensaries to focus and give effect to the educational movement. This is more especially the province of the Commission for the Prevention of Tuberculosis in France of the Rockefeller Foundation, though both agencies are in on the entire program from start to finish.

B. Immediate help in providing hospital care, home instruction, nursing, clothing, food, heating and other comforts. This is the special concern of the Red Cross.

The size of the tuberculosis problem cannot easily be overestimated. Deaths from uberculosis in Paris equal those in New York, which has practically double the population. It must not be supposed that France has ignored the situation. Tuberculosis dispensaries, hospitals, sanatoria and district nursing have been carried on, some of them with standards which match those of corresponding activities in the United States, but often without knowledge of what other agencies are doing and without any systematic covering of the field. The war, which has swelled the problem to unparalleled dimensions, cut short the provisions to deal with it.

### Tuberculosis Work Centered in Dispensaries

THE basis of the work of the Rockefeller Commission was a report by Dr. Herman M. Biggs, health commissioner of the state of New York and one of the ranking experts in the field of preventive medicine [see the SURVEY for May 5].

The members of the commission are leaders in the National Association for the Study and Prevention of Tuberculosis.1 The commission is making the dispensary with its adjuncts of visiting nursing, home education and the like the central factor in its campaign. It will parallel this with a system of nursing education, which has been relatively neglected until very recently by the French tuberculosis hospitals. It has under way an educational exhibit which will go from town to town, arousing practical interest not only in tuberculosis but in cooperation with the Red Cross Children's Bureau, in child welfare and other health problems. In one of the Paris arrondissements, it is opening a model dispensary with a complete equipment for all the social work connected with tuberculosis in the home. Similarly, it will open such a dispensary in one of the typical departements outside of Paris. On the basis of the experience in these two centers, it is anticipated that an adaptation of American methods to French conditions and a comprehensive plan for handling the tuberculosis problem in France as a whole can be formulated and presented for future action.

In all these plans the Red Cross will cooperate. To complement each dispensary except insofar as such provision is made by the French public authorities it will provide:

Home relief for destitute families in which there are cases of tuberculosis;

Hospitals for moderate and advanced cases when conditions are such that the patients cannot remain at home without being a menace to their families. One million and fifty thousand france have been appropriated by the American Red Cross to provide from fifty to one hundred beds each in conjunction with the first four dispensaries to be opened:

Care for children who have been inlimately exposed to serious cases of tuberculosis—either institutional care, of the nature of a preventorium, or a special régime, with medical and nursing supervision and special food in the homes.

4 The members of the Commission for Prevention of Tuberculosis of the Robelellis Fundation on Listington Farrand, M.D.: James Alexander Milier, M.D.; Homer Folts and Stefan Farrand, M.D.: James Alexander the Liva agencies is strengthened by the fact that Dr. Milier is consultant of the Bureau of Care and Prevention of Tuberculosis in the Department of Civil Affairs, American Red Cross, of which Mr. Folks is director. In hospital provision, the Red Cross has by three rapid moves made 1,000 beds available by January 1.

When the war broke out, tools, forges and equipment had been dropped at a large building in course of erection at the Bligny sanatorium. Neither money nor labor was available to complete the task and for three years the building stood in a half-finished condition. On the invitation of the Red Cross, architects and contractors have now banded together to utilize the materials in hand and the poor workmanship available. In the first place then, at a cost to the Red Cross of but 400,000 francs, 350 beds will be added by November 15 to those available near Paris.

In the second place, the institutions known as the Tuberculeux de la Guerre (for the development of which Edith Wharton had been mainly responsible) have been transferred to the Red Cross, including a hospital for twenty patients in Paris, one for two hundred beds nearing completion fourteen miles outside, two chateaux in course of conversion into sanatoria (some three hundred miles from Paris), stores of blantests, equipment, food supplies, four automobiles and some 1,300,000 francs in cash. These should add another three hundred beds by Christmas.

In the third place, by bringing new atmosphere into buildings already existing, the Red Cross is adding still another quota of beds. In the rush to care for its rapidly growing number of tuberculous patients, the city of Paris had erected baraquements on the grounds of six large general hospitals. The great amount of work thrust upon the civil authorities did not permit much leeway in making the buildings attractive. Three had no refectories and the patients slept, ate, dressed and went through the course of their sickness in the same room. The wards lacked reclining chairs and cushions and there was no provision for occupation or recreation. They have been hot in summer, cold in winter. As a result, only one hundred and seventy-seven beds out of four hundred and sixty-four were occupied when the Red Cross made a study of the minor needs of each baraquement. It arranged to contribute from week to week games, food, checkers, dominoes, folding stools to be used as tables and the like. These have been welcomed with enthusiasm and have been followed up by systematic visitation and social-service work by volunteers, who give personal attention to the needs of the men, provide entertainment and training and in general have set about removing the physical disabilities which have kept the beds from

The tuberculosis bureau also has undertaken to aid in the immediate provision of beds in other emergency hospitals, which were opened in convents, schools and factories and into which patients were put hurriedly without proper equipment.

Sufficient stores of food, clothing and coal have been ordered to provide throughout the winter for the many destitute cases which will come under the bureau's care in cooperating with the Rockefeller dispensaries. This work will include home visitation, domiciliary care of tuberculous cases, central registration and clearing house activities, hospital inspection and immediate relief of families.

The bureau also has liad translated and prepared for publication in pamphlet form a number of model American laws a part of the educational work to be carried on in conjunction with the Rockefeller Foundation.

# France Backward But Awakening

In GENERAL, while hitherto backward in the matter of official control of tuberculosis, France may be said to have experienced a national awakening to the gravity of the situation, whereas the United States had to be aroused state by state after long

STRUCK DOWN FROM BEHIND

The traitorous tuberculosis germ slipped past the enlistment officer into the camps and trenches. The anti-tuberculosis campaign in France, which made use of this poster, had made a small but spirited beginning before the arrival of organized aid from the United States.

effort. Through her central government, France can adopt plans that will make for uniform care, education and supervision.

This is equally true in the matter of child welfare. Here ground has been broken in a series of striking instances in which the American Red Cross has come forward with emergency aids.

Reference has already been made to the work of its Children's Bureau at Toul in cooperation with the American Fund for French Wounded where a children's refuge, children's hospital and general district staff of specialists in children's diseases, maternity work and recreation have been the American response to a call for help in caring for three hundred and fifty tiny refugees from German gas-bombing.

Toul is well within sound of the guns; Nesle is in the heart

of the devastated area which was evacuated by the Germans last spring. In mid-August an appeal came from the French Red Cross representative there which read:

In my sector we have about twelve hundred children, of whom seven hundred and fifty are from Nesle. Many of the children of twelve to fifteen years are menaced with tuberculosis. . . I therefore wish you would send to Nesle one of your doctors to visit our five communities.

The Children's Bureau answered immediately by sending a specialist in children's diseases, who found some 1,200 children scattered among the wrecked villages. They were practically without medical attention. Perhaps one-half were infected with skin or eye lesions and some were acutely ill. The local hospital had been stripped of its apparatus; there was one aged civilian doctor, left without drugs or means of getting to

the villages, one military surgeon with twenty-five villages to look after—aside from his army duties—and one midwife, fairly intelligent, who might help.

As a result of this survey, a medical center for children's service has been established at Nesle. The town offered an unused tuberculosis pavilion as a clearing house for the district. The Red Cross has equipped it, installed ten beds and added a traveling dispensary built on a Ford camionette, which will visit the nearby villages. This will carry a pediatrist, a trained nurse, equipment for the examination and medical care of the children and, most practical of all, a hotwater shower-bath under which they can be popped one after another. Similar children's centers are planned for Arras, Amiens and Ham as soon as doctors and nurses arrive from the United States to take charge.

### Five Hundred Destitute Children a Day

ARRANGEMENTS have been made for the Red Cross to take over the children's hospital work in connection with the reception, examination, diagnosis and distribution of children at Evian, the receiving station for repatriés near the Swiss border. These children often number well towards five hundred arrivals per day, many of them in very poor physical condition -some tubercular, some with minor skin diseases, some with more acute infections. A permanent delegate of the American Red Cross will be stationed here; ten automobiles and chauffeurs have been sent to aid in the prompt and more comfortable handling of the sick and infirm. The Red Cross will help the dispensary opened by the French government in the main reception building and will open a hospital of eighty beds for acute cases in the Hotel Chatelet. Plans have been made for two convalescent hospitals in chatcaux with space about them so that the children can take sun-baths and have some play while they are gaining strength.

As the basis for a comprehensive program, a careful study is being made of the statistics of infant mortality and children's diseases in Paris and other cities. Between forty and fifty institutions and associations doing children's work have been investigated, especially those dealing with tuberculous children. Some of them, against the odds of war conditions, are doing work which, if developed nationally, would blaze a way of promise for all France. Such is the work of Mrs. Edward Post (an American) at Finistére in Brittany, and that of the Oeuvre Crancher which places out some five hundred children in the country districts near Tours. Under its boarding-out system, these families care for pre-tubercular children until their home conditions become non-infectious and the children are in good condition, whether this be a period of months or years. Requests for further extension of the bureau's work have come from three army base hospitals where the American physicians have been quick to diagnose the surrounding conditions and urge the need of children's specialists in their localities.

Infant welfare statious will be established by the Red Cross in connection with each tuberculosis dispensary opened by the Rockefeller commission. The first is that in the nineteenth arrondissment—a great tenement neighborhood of Paris, where a complete unit will be installed—child welfare station, including a dispensary, small receiving hospital, milk station, including a dispensary, small receiving hospital, milk station, training school for nurses, out-patient social service work, home dietetics and recreation leadership. A child-welfare campaign through a traveling exhibit, educational leaflets and the press is being organized. The alarming decrease in births and the high infant mortality in France make this nothing less than the beginning of a work of racial conservation.

School hygiene work is the next sphere of child-welfare ac-

tivity to be entered upon by this bureau of the American Red

The Civil Affairs Department proposes to round out its health program with a health center which will be more comprehensive than anything of the sort ever attempted in America and which will have as its unit one of the departments into which France is divided. Public interest in the United States has been following the demonstration at Framingham, Mass., where local and national organizations are engaged in a united effort to stamp out disease and build up vitality. In resources and significance, this French center will be carried out on an altogether new scale.

While the health factor will be emphasized in the other bureaus of the Department of Civil Affairs, they are concerned primarily with the economic problem of relief and rehabilitation, and deal directly with those war-time social groups already enumerated—the multile, reforms, repatries, 'waeue's and refugiti—and with the work of reconstruction in the wartorn North.

The mutiles are the crippled soldiers of France. The chief of the Red Cross bureau concerned has inspected seven of the nine large centers where a work of re-education is carried on in connection with the military hospitals: Paris, Tours, Bordeaux, Toulouse, Montpellier, Lyons and Marseilles. Their three years' experience will be placed at the service of the Red Cross in America for guidance in developing similar work in the United States. The report will also enable the American Red Cross to determine what help can be given in France where perhaps 5,000 new war cripples are added to the rolls every month. The functional re-adaptation and professional re-education of disabled soldiers and sailors-"curative work" as it is called in England, "occupational therapy" in Canada-was the subject of an inter-allied conference in the spring [see Social Forces in War-Time, the SURVEY for September 29] out of which has grown a permanent committee.

The Red Cross was represented by its bureau chief at the meeting of this committee in London in October. Belgium was the first among the allies to develop this work. The beginnings in France were by private initiative and later the institutions have been developed under subventions from the ministry of war. France has much to give America in her remarkable originality in devising apparatus and training with which to fit men as cobblers, typists, machinists and the like; in return America can offer the experience of vocational concilors and social case workers to apply when that of the physician stops.

### Agricultural Training and Machinery

FULLY 65 per cent of the French mutility are from the French country districts and, excellent though it is, not more than 10 per cent of the training offered is in agriculture. The American Red Cross will open a further experimental agricultural training station near one of the large hospitals. Because of the labor shortage, farm machinery will become a big factor in French economy after the war, and the Red Cross will supply such machinery for teaching purposes at the French eenters. It will carry on an inquiry into industries heretofore monopolized by Germany with a view to establishing training in these trades in France.

After the French mutilé is discharged from his hospital treatment he becomes a réformé of the first class, is pensioned and comes under the ministry of the interior. No provision is made for the continued stay of these men at the training centers and, on request of the head of one of the most active and successful centers, the Red Cross plans to equip a barracks for their accommodation there which may prove the beginning of an extensive form of cooperation.

The discharged soldier who is incapacitated for military service, not through physical injury but through sickness—such as tuberculosis or heart trouble—becomes a réformé of the second class, without pension, and for purposes of the Red Cross falls within the field of its health service.

Cooperative arrangements have been entered into by the Red Cross and a group of existing societies for the re-establishment of the blind in their homes.

In numbers and in bitter need, the réfugiés are the great human embodiment of war havoc in France. Americans will be able to grasp the size of the relief problem in which the Red Cross will play a part, when it is said that their numbers—women, children, incapacitated men—exceed all the troops which the United States has under arms for the war. There are officially, roughly 110,000 réfugiés in Paris and 750,000 outside. But these are merely those so destitute that the government supplied them with allocation or transportation. The total is said to be 1,500,000 the

Classified according to their origin, the réfugiés are of three types:

The réfugiés proper—that is, fugitives from the front, mostly at the time of the German invasion. A comparatively small stream of

these has continued, as when Rheims was bombarded with long-range guns and, more recently, when the region around Dunkirk was under fire.

The évacués—those sent out of the war zone by the military authorities. These come regularly but not in large numbers.

The rapatriés—those left behind the German armies when they swept into France in 1914, who are now being sent back to France—the dependents among them—by way of Switzerland at the rate of 500 to 1,000 a day.

The repatries arrive at Evian, the French receiving station, in an exhausted condition after three days of railroad travel and several months of privation. They require care, medical attention and, in the case of the older people, a considerable period of complete rest and proper nourishment.

The French system of handling this human stream is to send the sick at once to the local hospitals; those not sick but exhausted go to the Maison de Repos; the great majority to the old casino where they at once sit down in the main hall to a nourishing meal served by the local committee and the women of Evian. The mayor bids them welcome, the Marseillase is sung and the old French spirit breaks the crust of endurance and stolidity that marks their arrival. Card records are made and, through an index system, relatives or friends who have communicated with the committee or who have already passed through, are put in touch with the new-comers. If without connections, the repatrici is sent to some

THE LONG, HARD BOAD TO HEALTH
"Help us to assist the convalescent soldiers who have suffered wounds or sickness but receive no pension," is the appeal
accompanying this picture on a poster issued by a French fund for the protection of the convalescent

predetermined préfecture in the departments of the Center, West, Southwest and Southeast. The préfets in turn distribute them in the various towns and villages, largely in houses left vacant as a result of war conditions. Decision is based largely on the trade or occupation of such as are still able to render effective service. Thereafter, in common with all réfugiés, they receive one and one-half francs a day for adults, seventy-fue centimes for children.

Mention has already been made of the fact that the Red Cross Department of Civil Affairs has placed a permanent representative at Evian, supplied ambulances and taken over the provision of medical care for children, who make up from 50 to 60 per cent of the war pilgrims. It is studying other needs, such as that of a tuberculosis sanatorium. If the major part of hospitalization can be done in the neighboring region, the saving in expenditure and in the fatigue of the patients will be considerable.

### The Refugee's Lot Hard, Even in Paris

DURING the past year, orders have been issued that no more rapatriés shall be quartered in Paris except those showing letters or telegrams that relatives there want them. The explanation is that the higher wages, the many charities and the special allowances of coal, potatoes and shoes have drawn the refugies to the capital in throngs despite the congested and miserable conditions in which many are housed. For the rétugiés suffer from the back-kick of a law which provides that families of soldiers may not be dispossessed from the houses or rooms they were living in at the outbreak of the war. The réfugiés have not, of course, benefited by this law; the landlords have been hard hit by it and to recoup themselves have charged the réfugiés high rentals when they have let them in at all. Moreover, a furnished room can be rented by the week; unfurnished rooms are paid for three months in advance. The réfugiés have neither furniture nor money, and so they are found living four, five, six and seven people in a single room. With sickness, squalor and malnutrition, with high prices charged them by the small shopkeepers, scant fuel and no knowledge of the way out, the lot of the Paris refugie has commanded sympathy but as yet no active statesmanship of remedy. Recently the French government has improved the situation by granting a special indemnité de loyer of five francs per person per month to aid réfugié families in paying their

Rather numerous hostels and refuges sprang up to meet the curregrency in the early days of the war, and, as way-stations for transients, have served an excellent purpose. Some of them, however, with their congregate eating and lack of privacy, have become centers of chronic miserable living. The bureau of réfugis of the Red Cross responded promptly to the significant appeal recently made by one such society for a large grant of beds and stores to enable it to establish in individual unifurnished rooms the families it had been housing in a large convent school. The society had come to believe that it was demoralizing the self-respect of the women it sheltered rather than encouraging and strengthening their sense of responsibility.

The bureau is cooperating with an able French woman, Mme. Brunschwe, who had taken houses that were only partially constructed when the war broke out, finished them, furnished them and installed some 3,000 families. It has taken over the group of four hostels which, with a distributing depot of groceries and other activities, had been maintained by Mrs. Wharton's organization.

The general program of the bureau in Paris includes the

further development of existing relief agencies (including the semi-official committee appointed for each invaded district), their coordination through some form of exchange of information to prevent overlapping, the raising of household conditions through visiting nursing, and aid in meeting the high cost of living through the provision of furniture and, if need be, of fuel.

The problem in Paris merges into the larger réfugié problem in all France which, like that of Paris, is largely that of congestion of population in the towns and cities of every department outside the zone of occupation and military operations. This overcrowding is naturally worst of all in munition and mining centers.

In mid-September the Department of Civil Affairs entrusted its bureau of réfugiés to Edward T. Devine, of New York, the expert in emergency relief who organized Red Cross aid at San Francisco following the fire and earthquake and was in charge of the extensive relief operations at Dayton following the Ohio floods. The assistant chief is Margaret Curtis, of Boston, an American social worker with two years' experience in war relief in Paris. The bureau has requisitioned supplies for the coming winter running into the millions of francs and, département by departement, is enlisting the cooperation of the government and the coordination of official and voluntary relief agencies in order that it may unify the distribution of stores to the active local agencies somewhat after the manner of work employed by the Commission for Relief in Belgium.

Since the réfugiés are mainly women and children and invalid men, and since many of the réfugié families have no able-bodied workers at all, the allowance from the government and from existing French agencies will need to be suppliemented by American Red Cross funds. Even in the families in which there are older children or women able to work, their earnings, although nominally high, are barely sufficient at present prices to provide food and clothing. It is utterly impossible for them to accumulate a sufficient margin to pay a quarter's rent in advance and to replace the furniture destroyed or abandoned in their original homes. If, therefore, these réfugié families are to have even the semblance of a home, it will have to be with substantial assistance from the outside.

### The Work of Relief and Reconstruction

THE Red Cross bureau plans, with the heartiest approval of the governmental authorities and those most experienced in relief work, to concentrate as far as possible on this particular task. In the cities and towns of the provinces, as in Paris, the greatest single blessing that can be conferred will be to move as many as possible of the réfugié families from the so-called furnished rooms into houses or apartments in which the living conditions will be more tolerable, the overcrowding and the danger to health less and the moral atmosphere more like that of the normal French family before the war. The essentials are dwellings, furniture and fuel. It is not a question of permanent support but of a substantial lift to enable the largest possible number of families to be reestablished in something like a normal household life. Barracks erected wholesale would not solve the problem. The people must live sufficiently near their work and where the children can obtain an education. However inexpensive, the apartment should be decent and even, if possible, attractive. Only by such means can the depression and discouragement which are the inevitable result of three years' physical hardship, accompanied nearly always by repeated bereavement and long-continued anxiety,

be in some degree lessened. Only in such ways can American generosity take up its appropriate and modest share of the accumulated misery and anguish of the three years of war in France.

Ten delegates are already engaged to develop and organize this kind of work in the departments and additional delegates will be sent from day to day until the Bureau for Refugees is represented in every department in which the conditions permit; such family rehabilitation to be undertaken. Every such delegate carries an official letter of introduction from the ministry of the interior to the priets of the dipartment and group of sout préfets appointed especially for this purpose under an appropriation of 300,000,000 francs voted as early as 1914. For its own purposes of administration, the American Red Cross has divided the whole devastated belt into six districts and stationed in each a resident American delegate. These districts include parts of the following departments: Nord and Pas-de-Calais; Somme; Oise; Aisne; Marne and Meuse: Meurth et Moselle.

The area liberated last March, made up of parts of the départements of Pas-de-Calais, Somme, Oise and Aisne, is roughly one hundred miles long and thirty miles broad at its

Little Pierre and Marie, with their eighty-year-old granny, are all that are left of a once prosperous farming family in a region now occupied by the enemy

another from the highest ecclesiastical authorities to the bishops and religious agencies whose cooperation will everywhere be sought.

The lodging problem has been considered insoluble. The Red Cross will try to cut the knot by supplying as many families as possible with essential furniture and by active cooperation in works of reconstruction, to hasten the day of return for families whose real homes were in the devastated areas.

The work of the Bureau of Reconstruction and Relief ranges along that desolate path of ruin behind the French and English lines from Belgium to Switzerland. The admirable relief work of the French government is in the hands of a

widest point. It tapers north to above Arras and south to Saint Quentin. It includes several hundred villages. Here, in the words of Edward Eyre Hunt, the experienced Belgian relief worker now chief of this Red Cross bureau, "twentieth century French farmers, returning rélugiés and rapatries, have to begin again where North American Indians would begin—by hunting for food, temporary shelter, for clothes to cover them, a few household goods and utensils, such as pots, pans, knives and spoons, an agricultural implement or two, and perhaps a rabbit and some chickens, and if they are very lucky, a goat or a donkey."

The German commanders brought the people of certain neighborhoods together at central towns which were left fairly intact; the able-bodied were deported; women with children, the old and feeble were left behind. Other refugees have straggled back to live in the cellars (cevex) or the half ruined structures of the wrecked villages.

To help such people as these, the Red Cross has located its relief warehouses at strategic points just behind the lines, such as Soissons, Noyon, Ham and Péronne, and is shipping in food, clothes, blankets, beds, mattresses, stoves, kitchen utensils, reapers and binders, mowing machines, threshing machines, garden tools and hundreds of other articles of first importance to people who were prosperous and contented only three years ago.

The resident American delegates will oversee the distribution of Red Cross relief, report new needs and cooperate in every possible way with the civil and military authorities, with the scores of devoted French and other œwers and with the more recent adaptations of neighborhood work to the liberated area by the Society of Friends, the civilian branch of the American Fund for French Wounded at Bleraneourt, the Secours d'Urgence at Roye and the Smith College Unit.

The practice of the military authorities is to assign certain villages, or even a whole township, to a given organization which then has right of way there. The waver settles down with a personnel of from three to a dozen people, and may begin its work by erecting a roof to live under. These wavers, of course, have affiliations in Paris and receive all the support their friends can give them, but they almost always lack money, supplies, personnel and transport—things which the Red Cross aims to furnish. At best, they are a leaven of good works for the district just as a settlement is often a leaven in a tenement neighborhood. They lay their hands to every-

Contrickt International News Service

During the summer months, thousands of families whose homes had been razed to the ground preferred to live in the open rather than be separated from their beloved farmsteads

thing. They ask for hardware, cloth, sewing machines, agricultural implements, rabbits, chickens, roofing materials, mosquito netting and carts or camions. Often the question of transport is the most severe of all. The problem for the Red Cross has been to arrange its district warehouses so that they can easily supply a large number of awwers and then to give them promot deliveries by motor camion.

District committees are being organized of representatives of the civil authorities and of the exerces and leading residents. Once organized, it will be through these responsible joint committees and on their recommendation that Red Cross supplies will be turned over 20 the village activities which deal with the sinistrées, as the people are called who have suffered loss by invasion but have not been driven from their districts, and the 'emigrees, the refugees who have come back."

#### Reconstruction in the Wake of the Germans

IN TAKING some part in the great work of reconstruction which must come in the devastated region the American Red Cross has, as a result of initial investigations, laid down these immediate lines of policy: to begin this fall in the region of large holdings and level fields about Nesle, as part of a concerted plan to augment the food supply; to undertake provisional repair work (as distinct from temporary wooden barracks such as the French ministry of the interior is erecting where houses have been completely destroyed, and as distinct from permanent rebuilding, which is an economic problem considered too gigantic for private enterprise to attempt); to begin with four villages and to expand its work in the light of the experience thus gained. The physical side of the work has been undertaken by the Bureau of Construction, with its divisions of planning and engineering; the social, economic and civic side by the Bureau of Reconstruction and Relief.

The French government has nineteen teams of ten American tractors each, ploughing wholesale for winter wheat in the liberated area. These belong to the department of agriculture and are rented out by the government through the préjets upon application by any group of land-owners who, together, offer enough acreage to make it economical to plough in this way. Forty francs a hectare (about 2½ acres) is charged, and this is, in truth, the beginning of a cooperative movement which may reach far. The agricultural department asked if the Red Cross would follow this work and help supply shelter to farmers who wanted to start in.

The scheme of life in these French countrysides is very different from that in America. The fields are unfenced; the farmers live in closely built villages of brick or soft stone; the houses stand flush with the streets; and the barns and stables in walled quadrangles behind, reached by gated wagonways. The surrounding fields and roads are intact, except for occasional heavy crops of thistles, for serious soil depletion, and for the shell holes, dugouts and trenches which mark the belt where the fighting zone ran. The German commands practiced sabotage on the agricultural implements. In some neighborhoods they felled orchards in bloom; in others they left them standing. The destruction of the villages was equally irregular, taking place either in the course of fighting, through shellfire or, at the time of the retreat, through systematic wreckage on the part of the German troops by fire, explosions or the use of rams. In nearly every locality some buildings were left standing susceptible of repair and in sufficient numbers to give provisional shelter if repaired.

The French government has announced the broad purpose of nationalizing the losses and as a transitional policy in addition to the heavy task of clearing away debris and clearing up sanitary conditions, military and civilian authorities have

These Belgian soldiers found their homes and properties gone when, on leave, they hurried to meet their beloved ones. Sometimes it was difficult to trace the wife and grown-up relatives; but the little ones were in good hands

through the summer been engaged in extensive repair work, contracted for ten thousand portable houses (maisons demontables) and erected some hundreds of them.

At the suggestion of the sour-préfet at Nesle, especially appointed for the work of reconstruction, and after an investigation covering fifty villages, the Red Cross chose for its demonstration work:

Croix-Molignaux, twin villages, with a population of 442 before the war which has dwindled to 32, and with 788 hectares of land round about.

Marigny, with a population of 920 before the war, now 16, and with 200 hectares.

with 200 hectares.
"Y," with a population of 148 before the war, 4 now, and with 273 hectares.

These villages are all in the southern part of the departement of the Somme. The farms run fairly large, many of them from 150 to 250 acres. The department of agriculture supplied the Red Cross with the names of farmers ready to come back as well as those already on the ground who were in no position to winter themselves or their stock without better shelter. These families, some fifty in all, are made up of women and children and the older men. Despite the vicissitudes of the German occupation and the heavy subscriptions which all French people have made to the government loans. they not infrequently have money laid away. But the country has been stripped of tools, labor and materials-and the sources of such things, given the transportation situation back of the war zone, are beyond the reach of individual families. The ministry of the interior put up barracks in a ruined farmyard for the Red Cross repair gang which has confined its work to such rebuilding in advance of winter as could provide shelter for the people and their animals as rapidly as possible and at the least expense. Generally nothing is being done to the main

farmhouse but a small outbuilding is repaired in such a way—a roof put on, holes in the walls closed, doors and windows set in—that it can be used as a dwelling.

Great difficulty is experienced, even in this meager construction work, in getting materials, especially lumber. Military needs are imperative and the railroads are all much congested. Brick enough can be found in the ruins, but almost every particle of seasoned wood has been burned. Lime could be made if it were not that coal is unobtainable for any such purpose. The great and as yet unsolved need of this work and of this region is labor—the most difficult thing to find in France. Here in the devastated region it is largely limited to old men and the maimed.

The Friends War Victims' Relief Committee has long been using educated but largely unskilled volunteers in the rough work of supplying shelter. Starting in 1914, in the face of reluctance if not opposition on the part of their government, the English Quakers have been the largest private operators and the pioneers in reconstruction work in the devastated regions finally carrying conviction at home, winning the most coordial appreciation of the French authorities and putting the results of three years' experience at the service of the American Red Cross.

They have maintained a wood-working plant at Dôle in the Jura mountains, turning out huts (of the maison demontable type) for the French department of the interior from lumber supplied by the French army. From Sermaize as a center, their building department has put up over 500 huts in 35 villages in the region of the Marne and the Meuse, and their agricultural department has operated and kept in repair 150 mowing machines, 42 reapers and binders, and 10 threshing machines; besides making distribution of farm tools, seeds, chickens and rabbits, and selling furniture to improverished

householders; all this in addition to a wide range of other activities, including hospitals, convalescent homes, district, nursing, the evacuation of children and sick from bombarded regions and relief and medical work for réfugiér and rapatriés in 300 villages. In this they have enlisted also some of the English conscientious objectors and the aid of their co-relicionists in the United States, Canada and Australia.

In August, the American Red Cross appropriated \$100,000 for the rapid extension of their work through the American Friends Reconstruction Unit, which trained 100 strong during the summer at Haverford, Penn., and went into the field in September, and the French authorities assigned nine villages near Ham to the Friends, so that they might carry forward in the area liberated last spring in the Aisne and the Somme the same types of work which they had demonstrated in districts which have been free of the invaders since 1914. The American Friends unit has become a Bureau of the Department of Civil Affairs of the American Red Cross, and the Red Cross is represented by two members of the managing body of the Friends War Victims Relief Committee (joint English and American) which is charged with the prosecution of the work. In addition to the enlargement of the Friends Maternity Hospital, the provision of a home for réfugié children and a Paris clearing house for sick réfugié cases, the Red Cross unit and grant have made possible a new workshop and construction camp for making portable houses, bringing the output (with manufacture and erection) to twelve houses per week; and an agricultural center in the new area like that at Sermaize (a number of the American unit being experienced farmers) which is specializing in plowing and other field work for the small peasant farmers who are not reached by the wholesale plowing of large tracts by the government.

The part which the Red Cross can and will be able to play in the larger reconstruction remains to be developed in the months ahead. How to get more light and air and better sanitary conditions without destroying the characteristic regional architecture is only one of the factors. Into this the French architects have thrown themselves with characteristic spirit, and national competitions were held the past spring and summer for typical farmhouses, barns, shops and industrial village dwellings. The French sanitarians, city planners and summer for expectations are actively discussing other factors, and this problem of rehabilitating the devastated districts merges into a larger one engrossing all phases of public interest, that of reestablishing the whole economic fabric of France and lifting its industrial life to that plane among the progressive nations which her natural resources and her native ability warrants.

This in turn is bound to affect, if not revolutionize, the equilibrium between city and country as the mode of life in France. Every hostel in the industrial centers, every natched roof in the little feudal villages of an earlier economy, every grant of furniture or fuel for the congested réfugies in Paris, every modern labor-saving agricultural implement that goes to the devastated region, every mutile trained in its use, tips the balance one way or another be it ever so slightly. Even in the midst of the war and in the presence of immediate needs, the Red Cross must increasingly study these larger bearings and adjust its cooperative work to them.

That tiny fragment of territory which is free Belgium falls within the scope of American Red Cross activities in Europe. The United States government has of course taken over from England and France the responsibility for furnishing the huge grants (\$15,000,000 per month) to the Belgian Reliet Commission which, through the Comité National de Secours et d'Alimentation, ministers to the needs of occupied Belgium.

The Department for Belgium of the Red Cross has made a careful study of conditions and needs among the military and civilian population within its reach, and among the Belgian rélugiés now cared for in Switzerland and France; but it has also laid plans for meeting the situation when the bounds of its work are very different from what they are today.

of its work are very different from what they are today, Preparatory to any gain which will move the fighting line materially eastward in Belgium, the American Red Cross has appropriated 1,000,000 francs to accumulate supplies of food and clothing as close to the front as practicable, to be drawn against instantly for the assistance of newly-liberated civilians. It has appropriated 500,000 francs for a number of warehouses in Belgium or close to the Belgian frontier, so located upon railways, canals and highways as to make it possible to move supplies quickly; a base warehouse will be established and canal barges have been engaged.

The Belgian wounded, who have hitherto been widely scattered in small groups in French hospitals, are to be returned to Belgium to be cared for under more favorable conditions. The cost of the erection of a new 1,500-bed hospital, which must be borne by the Belgian Red Cross, is beyond the present resources of that society, and the American Red Cross is making an appropriation sufficient to meet the deficiency. It is establishing canteens at a central point at Wulveringhem and at Gravelines, where the soldiers and civilians at Lyudians at Lyudians

Conditions of life in free Belgium are extremely difficult for the civilian population. The entite territory is within range of shell fire from the German lines and is also subject to frequent bombing by aviators. Much use is made along the Belgian front of gas bombs. Finally, the territory is so densely occupied by the allied armies that normal life is impossible. This condition of things affects the children most seriously and the Red Cross is aiding in efforts to remove them to safer homes and afford them schooling.

Under, the patronage of the queen of Belgium a colony for children was established at the little town of Vincken more than two years ago. Several buildings were erected in the open country amid fields and gardens, and the school has grown until at present it shelters 500 children. Children are admitted between the ages of four and thirteen years. While the school is within reach of the long range guns of the enemy and might easily be attacked by aviators, it has always been entirely free from harm. The colony has not been able to receive babies under four years of age. They cannot well be taken into France or Switzerland without their mothers and are particularly subject to the prevailing hardships. The American Red Cross will erect and equip a special pavilion for these little ones.

About 6,000 children under sixteen years of age have been placed by the Belgian authorities in colonies or family homes in France. The work can go on only so fast as accommodations can be provided; and the American Red Cross has appropriated 600,000 francs to extend the existing colonies so as to care for 600 more children. It is providing for an even larger number of children from occupied Belgium, brought through Switzerland to the south of France.

THIS is the second of a series of articles by the editor of the SURVEY on the work and plans of the American Red Cross in France. The first may be found in the XWEY for November 24. Later articles will describe and interpret various where aspects of the far-flung work of American social service overseas.

# The Health of Soldier and Citizen

# I. Europe

# By Gertrude Seymour

OF THE SURVEY STAFF

ENGTHENING shadows drew across the streets of a little village of Picardy one autumn afternoon three years ago. The stillness of the day was broken by the sound of an approaching ambulance trainmoters and carts taking wounded soldiers to the base. Many delays had occurred on the journey, for out-going troops must always have the right of way. And so the sick men were very tired, too tired to respond to the salute of a poilu in the village or of the aged peasants who took their pipes from their mouths as the train passed, too tired even to notice that M. Ie cuse came from the chapel and stood bare-headed to watch them out of sieht.

A Canadian soldier saw this and wrote of it in his home letter. And his sketch is placed at the opening of this paper because it is the miniature of a great element in the war—the sick soldier. During the progress of the war the soldier will be thought of primarily as fighter; in the retrospect of history he will appear as sufferer also—as a new challenge to medical science. All the knowledge and art of medicine have been brought into play as never before. In the midst of a contest with known disease on a scale hardly imaginable, it has had to face new disease for which previously there had not been even a name. With new achievements in treatment and alleviation there has come also a demonstration of sanitary protective measures that reach from battlefield to countryside and from trench to city street.

War has tested the ability of modern medical and sanitary science to cope with remarkable conditions. New methods of action have drained human endurance. The capture of thousands of prisoners created new settlements of population where no adequate preparation had been made for them. New missiles, delays in rescue, exposure to polluted soil threatened for a time to render meaningless the word antiseptic. And the throngs of troops of many races, assembling in foreign climates, were exposed to strange infections and themselves in turn carried into the new surroundings the infections of their native lands. To these infections civil as well as military populations were open, since interrelations between soldier and town cannot be wholly broken off. Prisoners are taken, billets may be necessary in towns and villages, there are hours when the soldier may go free, refugees must be cared for and the very grace of hospitality becomes a means of spreading infection. As one writer said of the reception given to Belgian refugees in London: "Poor vied with rich in showing practical sympathy. . . . Families that had barely enough for themselves pinched and squeezed to show hospitality,"

A ND then there are the incidental demands upon the army medical force in parts of the country where local physicans and health authorities have been called into military service. French medical officers give this service under the instruction of the war department and without payment. English doctors have naturally followed the example, treating wounds from stray shells, teaching a peassant a hasty lesson in the sanitation of his well or serving as an emergency accoucheur. But there is no official record of all this, though the case smertimes numbered two hundred and forty-five a day. "It

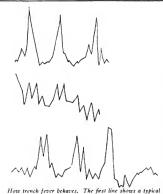

just seemed the natural thing to do," said one officer by way of explaining the absence of statistics.

Records available for the past three years show a remarkable difference between the medical experience of western Europe and that of the eastern countries, Poland, Galicia, Russia. In the East, crude epidemics followed at once upon the surgings to and fro of thousands of human beings during the first wild year. The West tells a story of disease control. Cholera, typhus and smallpox have gained no foothold among French and English troops, but little among Italian.

G O grave had the situation upon the Russian border become, late in 1914, that a special "hollera service" was called out by the Russian government. Switzerland quarantined against Austria, Galicia, Poland and Russia; Vienna acknowledged that cholera was "rather frequent" in the troops on the Russian frontier and that a serious epidemic had broken out among the civil population along the border. The death from cholera of the only Austrian officer who refused vaccination, thought from Berlin a prompt re-vaccination order for all rail-way employes in the eastern part of the empire. Trieste developed nineteen cases in ten days, each in a different part of the city, but traced them all finally to a carrier employed in a central market. Athens reported that cholera was "raging" in the Turkish army. Reports of the disease in different parts of Germany frequently add, "brought in by Russian prisoners." Even during the first half of 1917, 2,400 cases were reported.

Conditions were not much better in Galicia and Poland. At Cracow one cholera case was found in October just before trains from the East brought other cases, thousands of people being inevitably exposed to infection en route. These 14,000 were quartered in one village, vigorous anti-cholera measures were applied, and only twenty new cases developed. A German physician was sent to a village of seventeen houses where 480 men in various stages of cholera were lying on wet straw in rain-soaked tents. Some had been there for five days. The ductor took possession of the five largest houses of the village. sent the owners to visit their neighbors, applied control measures and stamped out the epidemic. When they were ready to abandon the place, his aids carefully sterilized and whitewashed rooms and furnishings and, adds the doctor appreciatively, "The villagers gladly aided to expedite our departure."

Whether the typhus epidemic of Serbia in 1915, will prove to be the greatest of these years, will not be known until the medical history of the war is written. Germany has not been without typhus since 1914, when the first virulent infection was brought from Russia. The disease was reported as "serious" in the great Russian prisoners' camps of both the central powers, but figures for 1915 were "not made public." Such records for the following year as were made public are incomplete. "Official statistics which were published in Berlin, December 3, [1916] state that on August 1 of this year there were 1,663,794 prisoners of war in Germany. In the two years of the war, 20,297 prisoners had died; of these 6,032 died from tuberculosis; 4,201 from typhus fever; 6,270 from wounds, and 6,605 from other illnesses." (Berlin Letter to wounds, and 6,605 from other illnesses." (Berlin Letter to

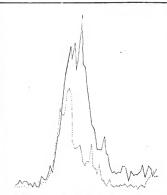

How trench fever behaves. The first line shows a typical weekly rise of temperature, rising toward evening and sinking about thirty-six hours later; the second, a case with relapses at intervals of two days; third, called the long type, characterized by frequent, sharp and regular relapses. (Courlesy Dr. M. J. Rosenau, Freventive Medicine and Hygiene, Appleton.)

the Journal of the American Medical Association, December 9, 1916.) But evidently 6,189 are not here accounted for.

They learned in Galicia also some practical lessons concerning typhus. Clothing must be so arranged that vermin cannot get inside, wrote one doctor. Another learned to stand to windward when helping typhus patients to undress, that lice might not be blown toward him. A physician who had practiced for twenty-one years in Galicia, wrote that he encountered it constantly, averaging 100 cases a year. He believed it endemic in certain parts of Galicia, marshy places without sanitation of any kind. He considered it probable that here summer flies and mosquitoes or even fleas might share in the transmission of infection, an impression gained from instances of the disease in inspectors and other officials who had only looked into the room where typhus patients lay.

RACIAL difference in susceptibility is also reported. Physicians working among the Russian captives in one Austrian camp noted that the Russians had the disease mildly whereas it was severe among the Austrian physicians and attendants. Mortality among the Austrians was 24 per cent and over; none of the 300 and more Russian typhus patients died. Percentages of deaths among German attendants and physicians were suppressed by the censor, though the comment stands that "the Russians display a much greater resistance than the Germans do." Similarly it is reported from Tsing-tau. the former German base in north China, that 33 per cent of the Europeans contracting typhus there died but only 11 per cent of the Chinese. Such instances are said to indicate a possible racial immunity to the disease. Among Austrian civilians, 13,000 and more cases were reported in 1915; 12,000 in 1916; and in the first three months of 1917, 3,000 new cases, These are for the most part in Galicia, but cases are reported also from Bosnia, Hungary and Herzegovina.

The cases of cerebrospinal fewer reported from Spfember, 1914, to the ond of 1915 in England and Water. The dark line represents civilian cases, the broken line, military cases. The largest number of civilian cases in any week was 163; of military, about 90. (Chart sketched from special report of the Local Government Board, N. S. 110).

Special effort was concentrated upon Poland by the German sanitary administration in order to prevent the spread of "epidemic diseases of every kind" native to the region and stimulated by infection from Russian soldiers. In Warsaw and adjoining regions 16,000 cases of typhus are said to have occurred in the great epidemic, 8,000 of these in the city itself. According to the Berlin Letter, dated March 7, 1916, the following measures were at that time in operation: Notification of all infectious diseases native to the region, also of all cases of uncertain diagnosis; increased laboratory service; 250 new isolation hospitals built; a floating disinfection station placed on the Vistula-all in addition to the eight stations already placed at points on the Polish border near railway depots, each station consisting of eight buildings in which 500 men can be received at once, cleaned, examined, disinfected and about eight hours later passed on for further treatment. That eight institutions caring for 12,000 each day were insufficient to cope with conditions tells an important story,

Smallpox developed and, encouraged by the absence of compulsory vaccination, spread among troops, prisoners, refugees and people. 1915-1916 saw in Austria proper over 50,000 cases with 42,000 more in the provinces mentioned.

Dysentery is still acute in Prussia, according to a report of September, 1917. Of 13,000 cases since the beginning of the year, 8,000 had occurred in the fortnight preceding the report. Malnutrition is offered as a possible explanation of the condition both there and in Austria, for even milk was scarce and when available had already been robbed of its fat for use in munition factories. A Vienna newspaper is quoted as saying that not cholera itself fould be worse than the dysentery then raging. Hospital accommodation was more than overtaxed and the institutions of the "general" type were not provided with the additional toilet facilities for such an emergency, The

result was utterly indescribable until emergency outfits were secured and installed.

The epidemic of dysentery among British troops in Mesoptamia was caused by carriers among soldiers from north Africa. According to one account, the troops could not effect a sufficient landing to set up hospitals; transportation facilities were inadequate; medical supplies gave out—altogether the five days' return trip down the Tigris in a side-wheel steamer was an experience which the sick men still remember. But the conquest of Tigris water into a safe drinking-supply was a chemical triumph deserving of more than passing mention.

One questions the cause of such conditions. The high excellence of German attainment in sanitation is beyond question, also the prestige of Vienna and Budapest in science. Health departments in cities of Poland, Galicia, Austria and Russia, are said to be well organized and in charge of high-grade officials.

One answer is suggested by the experience of the physician who found typhus endemic in Galicia. There is no effort on record to eradicate the infection from whole areas on such a scale as the malaria eradication work begun in southern France and northern Italy, or the yellow fever and hookwork campaigns in this country. Still further, the poverty and habits of a large proportion of the population are to blame. Of Galicia's eight million people a large number are engaged in mining and iron industries. Squalor and overcrowding in the towns, says Dr. Bruce Low, in his special report on typhus to the Local Government Board, 1916, make typhus a regular autumn visitant, the cases increasing toward spring. Infection is often spread-as in Ireland (which, by the way, shares with Galicia and Mexico the doubtful honor of being one of the world's three foci of typhus)-by the peasant ceremony of a funeral feast or "wake," quite regardless of what caused death. The spread of typhus is directly furthered also, according to Dr. Low, by vagabondage, "Homeless vagrants travel slowly and spend their night in overcrowded and insanitary lodgings. They seldom wash and wear the same clothing day and night. This class gravitate to prisons, night shelters and low-class lodging houses: thence to hospitals. where their clothing may bring infection to attendants and doctors,'

On the Professor Pales.

One rather amusing difficulty which German sanitarians had in dealing with Russian typhus patients came, one would think, from the frugal instincts of the Russian peasant. He preferred to bury his vermin-infested clothing against less exacting days rather than submit it to this mysterious process of disinfection; and if unable to hide it thus, he tried to sell it to a countryman going to another place—a custom containing "leads" for the epidemiological.

OBVIOUSLY it is no easy task to educate a "public" of far as one can discern in the records, there has been little if any attempt to do so. The health departments seem to be rather research centers than headquarters of general sanitary administration. A further proof of the novelty of health information may be the enthusiasm with which the occasional exhibits of which one reads, or lectures of a popular type, seem to be received in these countries. But the number of such popular educational devices is certainly increasing in all the countries of eastern Europe, and the numerous "special courses" for nurses and visitors among the people may be a nearer approach to such work as that of our public health nurses than these fragmentary reports reverb.

But even with modern methods and full authority, the task is a slow one. Even Germany had a problem of popular sanitary education. An article in Therapia for Gegemuar (Berlin), August, 1914, recalls Koch's injunction that a campaiga be kept up against malaria in southwestern Prussia so that when the time came for the troops to enter that district again they might do so without fear of disease. In spite of this, says the article, malaria is by no means conquered there. If 1904 saw over 3,000 cases in the region, 1913 saw still about 1,100. And recalling also the typhoid lingering in the region and various insanitary conditions, the 'article concludes with a familiar injunction, "The people must be taught to wash their hands!"

It is of interest to note in passing that the Austrian budget for 1914-15 included a large sum for "sanitary and social purposes." Among these were work against malaria in the Southwest, against pellagra and trachoma in the Tyrol and east-

AS soon as there was time to supply preventive and curative measures to the three million French troops, the number of diseases and of deaths fell to a remarkable degree. The 16000 cases during the first month of 1915 are only 2010 as year later and less than that early in the present year. An equally striking decrease in the number of deaths in the same time is shown in the second chart. Both cuts were made from the charts weed by Surgeon-Maj. Eduard Kist at the convention of the American Public Health Association at Washington in October.

ward; opening new laboratories; and issuing publications on infant mortality, sex education and general hygiene. Perhaps the creation of a ministry of hygiene and social welfare [the SURVEY for August 25] means that the timely appropriation was passed and is now available.

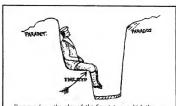

Before turning to conditions in the western part of Europe, note the status of the medieval terror, plague.

In a striking article on the history of plague, appearing in the Scientific Monthly for June of this year, Dr. David Greenberg of the American Museum of Natural History says: "Very few people realize that at the present time we are in the midst of a potentially serious pandemic [of plague] and that only the constant vigilance of our authorities enables us to avert such epidemics as culminated in the Black Death of the fourteenth centure."

"No rats, no plague," Dr. Greenberg gives as the only slogan of safety. In the more thrilling stories of war events, details regarding the examination of thousands of rats year in and year out and the finding of one infected by plague, pass unnoticed save by the few alert to the meaning of such figures. But the upheaval of humanity naturally causes a disturbance among rodents and their migration is a fact to be watched with closest attention. In the hands of inspectors at quarantine and workers in port laboratories, rat guards and test tubes are no inconsiderable weapons of national defense.

In the French and English armies, there have been few epidemics, said Surgeon-Major Eduard Rist of the French Scientific Commission, speaking before the recent convention of the American Public Health Association: "There has been no typhus in France, though troops came from Morocco where the disease is endemic. There has been no cholera. The epidemics which we have had were typhoid in the first months and tropical dysentery, now under control. Malaria also is prevalent."

The task of controlling typhoid opened a brilliant chapter of new medical history. In the urgency of mobilization there was no time for France to make a thorough examination of the individual soldier. Inevitably there followed upon the assembling of thousands of men a severe epidemic of typhoid. Research directed toward the conditions both in the zone of the army and in that of the interior presently found confirmation of a theory which has been winning acceptance ever since the Spanish-American War—that in many cases of so-called "typhoid" there were symptoms which could not be fully explained under that name only. In abundant numbers there were found in the French laboratories organisms named

Pressure from the edge of the fire-step, on which the man in the trench may "rest" for a few moments, helps to check circulation and predisposes to trench foot, (Courtesy Dr. M. L. Rosenau, Preventive Medicine and Hygiene, Appleton.)

by bacteriologists, paratyhouu A and B. And paratyphoid, "first cousin to typhoid," was demonstrated—and also controlled. For the vaccination which in so many instances hitherto had failed to protect against what was supposed to be an a-typical attack of typhoid fever, became splendidly successful when to the bacillus of typhoid in the vaccine there were added the two other closely related bacilli. Major Rist's dramatic charts on page 229 tell the story to the eve.

The outstanding epidemic of 1915 in western Europe was that of cerebrospinal meningitis which broke out in a British training camp. Cerebrospinal fever has been called a disease of children and soldiers, especially, says Rosenau, soldiers living in barracks, garrisons or camps rather than those in the field. Since 1912 it has been a notifiable disease throughout England and Wales; for the five years earlier its notification had been compulsory in London. Lack of close acquaintance with the disease in earlier years doubtless passed many actual cases which were locally known as "stiff-neck fever" or "epidemic neck-cramp." Wales has been singularly free from it; Ireland has suffered, some outbreaks reaching a mortality rate of 79.4.

### An Epidemic in Camp

The difficulty of identifying the disease is great because of its many forms. The International List of Causes of Death, adapted to England and Wales, gives under the heading, "meningitis," first, cerebrospinal fever, for which there are four different terms; posterior basal meningitis, five terms; and "meningitis—other forms," twenty terms, not including the tubercular or rheumatic forms.

That these forms of disease of the cerebrospinal nervous system are increasing is shown by the figures of the English Local Government Board for 1912-14, which showed the disease to have been steadily prevalent rather than epidemic, the incidence greatest among children under 15 (74.82 per cent), greater among males than females, but in both of a high fatality.

Attention was focused on the disease in laboratories of the Local Government Board and a detailed report, issued after the epidemic of 1915, is striking for the extent of the problem it presents to science, health and social administration alike. It emphasized the risk of overcrowding in either town or camp.

This report assumed an even greater importance because of the outbreak in the British military training camp. Suitable barracks could not be erected on short notice and the winter of 1914-15 found soldiers overcrowded in such barracks as there were and billeted upon the civil population. Soon it was evident that cerebrospinal fever was becoming epidemic.

The story of that outbreak is of special interes: from the point of view of public health. The attunulating cause seems to have come from Val Cartier, the Canadian training camp, soldiers from which reached England in October. Three cases occurred on the voyage. Records of the early cases indicate that the disease was conveyed by carriers, themselves healthy, to persons susceptible—the child in the inn frequented by Canadian soldiers, the boy who delighted to play in the Canadian camp. Histories of direct infection are numerous, especially among those who had cared for cases of "influenza," also, lest the matter be settled too easily, many instances with "no record of infection," sporadic cases, as the woman of forty-six living with her daughter on a farm. The total number of cases notified during the year 1915 was 2,565.

Cooperation was promptly effected between the local community, the military authorities and the health officers and central board. An adviser from the Local Government Board was asked for by the community—Salisbury Corporation (town council), which also furnished laboratory facilities under the direction of Lister Institute and vaccine for the protective inoculation of the inhabitants, more than 3,500 of whom accepted the offer. Says Dr. R. J. Reece, of the Local Government Board, in his statement regarding the epidemic:

This is the first instance in England in which as attempt was made to render a population immune to epidemic cerebrospinal fiver through protective inoculation, and though only about 11 per cent of the cenus population were inoculated, special attempts were made to secure the inoculation of all contacts. In this way it is conceivable that the bulk of those who were especially exposed to infection were dealt with. The numbers are too small to afford a basis for deduction as to the advantages gained from the procedure adopted. It is on record that (1) no definite illness, either local or general, beyond normal reaction, resulted from the inoculation and not a single case of sepis occurred; (2) no inoculated person contracted the disease, of sepis occurred; (2) no inoculated person contracted the disease, instances all the junior members of the family had been inoculated except the one attacked; in another the fasher was the patient and his children, incoulated previous to his stack, were not affected; and in one instance an uninoculated child of a family of six, two of whom had been previously inoculated, was attacked.

In France the disease has occurred sporadically, epidemics being rather definitely localized and, as French observers have pointed out, occurring usually after a period of severely cold weather and apparently related to prevalent influenza. The Low Countries and Scandinavia appear to have little cerebrospinal fever. In Germany, cerebrospinal fever has in recent years become prevalent at times among soldiers in barracks and among the inmates of prisons, workhouses and similar institutions. Of the German states, Prussia has suffered most in late years, sepically in the province of Silesia, a coal-mining region. Austria has had the disease also, almost steadily for the past twenty-five years. As to the experience of these countries during the war, records are fragmentary.

#### New Foes at the Front

IN ADDITION to the old foes in epidemic form, new ills appeared in western Europe in 1915, diseases not hitherto known or described. They are nearly all associated with the trench type of warfare and may be passed with very brief mention.

"Trench foot" (frost-bite or "water-bite," as it was at first called) is a condition resulting from fatigue and the lack of circulation in the feet after standing for hours at a stretch, often in polluted water. Circulation is further hindered by pressure under the knee when the soldier snatches a rest by sitting down on the firing step. Tight shoes and puttees that shrink complete the mischief. "Pins and needles," or "going to sleep" sensations are the first warning. The feet swell as blood clogs in the capillaries and unless treatment is prompt, gangrene sets in. It is noteworthy that among the Belgians, who wear no puttees, and the Russians, whose footgear is a piece of heavy flannel tied inside a loose shoe, trench foot is very rare. The term frost-bite is now generally discarded, for the condition is in no way dependent upon temperature. Sir William Osler traces the influence of nervous fatigue in this affection, because of the extreme sensitiveness that extends sometimes only through the foot itself, sometimes reaches the ankle, sometimes becomes a complete nervous breakdown. "The truth is," he wrote on February 3, 1915, "the trenches have been a veritable hell and it is not surprising that a good many of the men show signs of severe nervous shock."

"Trench fever" is a vague fever of recurrent type, as the typical chart shows. Headache, general malaise or "all-overish-ness," sometimes with "grippy pains," are its highly perplexing symptoms. Said a British physician:

The Service de Santé, with a certain French army. (By permission of Admiral Braisted from a report on Medico-Military Aspects of the War, by Surgeon A. M. Faunt-lergy.)

The most striking feature in the condition of the patients was the absence of any objective signs. There was little constitutional disturbance, and only three patients looked really ill. The temperature was a first raised, then fell to normal, and this fall was followed by one or more relapses . . . It is certain that the disease is not not considered to the control of the contr

Attempts to trace the exciting cause of this fever are said to be thus far disappointing.

"Trench jaundice" is attributed by some medical officers to a specific infection; by an increasing majority to the influence of nervous factors upon the functioning of the liver. Attacks seem to be most frequent in idle times and in the spring and often coincide with expressions of homesickness.

Several causes of "soldiers' heart" are on record. A previously sedentary life causes often a weakness of the heart that is concealed in the excitement of recruiting and even in preliminary training. Excessive tobacco, alcoholism, drugthabits or some form of syphilitic affection, are found in thistory of various cases. A genuine neurosis is apparently the only explanation in a large number of cases and the instances of this belong to a future discussion on nervous cases.

The question of tuberculosis abroad has already been discussed in the SUNVEY (May 5, 1917) and will be later reported. So also the remarkable work in war surgery that is linked everywhere to the training of wounded or maimed men in a new trade or profession.

A closing résumé of actual methods of sanitary control is needed at this point. And first among these is the detection of carriers. That the healthy human being may for months or years carry organisms which work disaster to his more susceptible neighbor has long since been confirmed. Instances of this kind have been mentioned already in this paper—the

carriers of amoebic dysentery who conveyed infection to the Pritish troops, the cholera carrier in Trieste who from the vantage point of a public market started nineteen different cases in the city. In a garrison of 2,000 men at Capua, 600 carriers of meningoocci were found during an epidemic of cerebrospinal meningitis. Later two hundred more were found, some being among the "recovered" case. Circumstauces attending this epidemic (i. e., cases among the cavalry only) suggested an inquiry concerning the part played by animals in the outbreak, but the investigation has apparently been postponed for the present. The detection of hookworm in a reservits tooller at Rome brought out a warning to Halaina sanitary authorities to be on the watch for unusual

A second step in sanitary technique is watching the exposed. When a rise of temperature gives the medical officer so wide a range of diagnosis as measles, mumps, early small-pox, typhoid, typhus, malaria or even plague, precision is a matter of some importance. And as measles can cause an inconvenient degree of disability, that ailment is as carefully watched for as any other. A train of two hundred soldiers reached a certain eamp. Next day one man came down with measures. The one hundred and ninety-nine contacts were notified to appear for examination of nose and throat at 3 p. xi. daily till further notice. Cultures, swabs, sprays were the daily drill and only five more cases occurred.

Systems of notification have been put into effect. Local

health officers have notified nilitary officers of the incidence of sickness near camps or zones of action and occasionally have received word in return of illness in camp. Even within the armies, knowledge of disease existing in one part has helped to determine the diagnosis of a difficult case in another; for symptoms have been strangely modified at times. Actual typhoid might have been taken for slight fatigue in one place had the medical officer not been on the alert knowing that there were cases of typhoid in the next division and therefore taking no chances in the case before him.

Prompt isolation of detected infections, prompt use of vaccines and sera, externination of rodents and insects, purification of water-supply, application of proper tests to all connected with the commissary departments, laboratories at home as a source of supply and a means of research in difficult questions, laboratories at the base for active service, motor laboratories to take quickly to any part of the field a needed supply and render special assistance there—it is all the best sanitary technique of civil life applied on a marvelous scale to the new circumstances. And finally, be it said, that personal hygiene is, when possible at all, more the interested and voluntary concern of the soldier than exclusively a matter of compulsion. "The men want to keep fit:

If there at once occurs the grave question about venereal disease—that is the result of a social tradition less trust-worthy than that of the new hygiene. It will be the subject of a later paper.

# Organized Labor in War-Time

The Convention of the American Federation of Labor

By John A. Fitch

OF THE SURVEY STAFF

ID organized labor really express itself at the convention of the American Federation of Labor which adjourned last week in Burfalo? If it did, what did it say? That is the question that constantly recurs when one attempts to analyze the action of the convention, and to interpret its significance. The two outstanding superficial impressions of the convention are its harmony and its particists. Are they correct.

The changes in point of view and in attitude in this convention over that of one year ago, in Baltimore, are radical and some are perplexing. It is not strange that, for President Gompers "lay on MacDuff" in his ringing defance of the employers one year ago, there should be substituted fervent exhibitions of patriotism and denunciations of the Kaiser. We are at war and the whole tone of the convention reflected that fact. But many of the speeches and resolutions in this year's convention indicate a change that is remarkable.

At the Baltimore convention a resolution was adopted condemning military training in the public schools and stating that the American Federation of Labor is "utterly opposed to militarism." The committee to which this resolution was referred in that convention recommended that it be rejected. Andrew Furuseth was chairman of that committee and therefore was the leader in the fight for its rejection. James Duncan, president of the Granite Cutters' Union, was the most prominent figure in the convention to argue for its adoption. Mr. Duncan said that he, had come away from the previous convention "broken-hearted" because a resolution of this character had been defeated, and he pleaded for its adoption.

This year, although Furuseth did not speak in opposition to the present policy, either of the federation in support of the war or of the government of the United States in entering the war, it was well known that no delegate was more dissatisfied with the present state of affairs than is the president of the Seamen's Union. James Duncan, on the other hand, the pacifist of 1916, has so placed himself on the side of the government in the present war that he was selected by President Wilson as the labor member of the commission sent to Russia, and he stood sponsor on the floor of the convention for some of the most distinctly pro-war resolutions.

I do not mean even to suggest insincerity in either Mr. Duncan or Mr. Furuseth. The Scamen's Union, under the leadership of Mr. Furuseth, has given loyal service to the government of a distinctive character, and Mr. Duncan's opposition to military training, in time of peace, had no particular relation to his support of the government in war time. But the changed role of these two men on the floor of the convention indicated very strikingly the changed situation in which the federation finds itself.

The dominant note of last year's convention was militant opposition to non-union employers. The dominant note this year was loyalty to the government. There could be no doubt about that from the unprecedented opening of the convention, with an address by the President of the United States who

had taken an all-night railroad journey for that purpose alone, to the very end, thirteen days later, when the Executive Council's report on terms of peace was discussed. There was no time when the thought of the government and war were not either in the background of discussion or prominently and specifically the subject for consideration. And so old issues were forgotter, old difficulties were wiped out. It could no longer be predicted with safety how a delegate with a known record in a dozen or more conventions, would east his vote in this convention, except on the one subject of loyalty to the government.

#### Rout of the Pacifists

So eacea were the majority of the delegates to go on record that they did not wait for the main issue to arise. Significant of the spirit of the convention on this subject was the action on some of the resolutions that dealt more or less directly with war. On Monday, November 19, a resolution of no great importance was offered for passage endorsing the American Alliance for Labor and Democracy. This led to the one supreme battle of the convention. Throughout an entire afternoon the debate raged back and forth, not so much upon the merits of this particular organization, fostered by Mr. Gompers as a sort of counter irritant to the People's Council, as upon the attitude of the federation officials toward the war. When at last the vote was taken by roll-call, only fifteen delegates, representing 402 votes, opposed the resolution. Delegates representing 21,602 votes voted in favor of it.

The only other record vote taken on a similar issue was on a resolution recommending the extension of the conscription law to aliens living in the United States. Twenty delegates voted against the resolution and more than 400 in its favor.

Singularly enough, these test votes came on minor or subordinate issues. When on Tuesday, the next day after the great fight of the convention, a committee recommended the adoption of a resolution endorsing every single act so far taken by President Gompers and the Executive Council in connection with the war, it was adopted without discussion and by unanimous vote. This is one of the facts that makes it difficult to analyze with very great assurance the attitude of this convention.

It was to be expected that there would be enthusiasm in support of the government. That is probably the explanation for the resolution that proposed that immigrants should no longer be admitted to membership in unions until they have either become citizens or expressed their intention of so doing. The reasons advanced against the adoption of this resolution were obvious and sound. It would make the employer give preference to aliens; it would stimulate membership in the I. W. W.; it would make strike-breakers incidentally of the Chinese on the Pacific Coast who are ineligible to citizenshipso the resolution was rejected. This was a sound and reasonable action, but it leaves one a bit puzzled. Not all of the acts of the convention were equally sound and reasonable. On Monday, approval of the Alliance for Labor and Democracy was made the test of loyalty to the government. There seems to be no very good reason why, on Wednesday, the resolution to bar aliens from unions was not similarly made such a test. Here the patriots were mildly inconsistent. But why were the pacifists so reasonable in their attitude on this question when the day before they had so enthusiastically and illogically voted to keep the conscription law discriminatory and unjust, in respect to the exemption of aliens from its provisions?

These are questions that cannot be answered. The situation back of them is merely another of many indications of the difficulty that the labor men have experienced so far in adjusting themselves to the new and unfamiliar conditions arising from the war.

Never was the breaking down of old prejudices and old alignments more clearly revealed than in the private convenation of delegates whose position has been well known in the past. I asked a man who has been prominent as a leader of the radicals what his attitude was toward strikes. He said there shouldn't be any strikes now that we are at war. I asked him if he would favor compulsory arbitration and he replied, "I'm for anwhiping that will help win this war."

Another, a Socialist of long standing, told me that if he could be absolutely assured that a compulsory arbitration law, if enacted, would be operative for the period of the war only and then become definitely and positively inoperative, he would publicly urge its adoption. It was a conservative leader, one of the ablest of them and whose stand "with the President" is beyond question, who told me that not even as a war measure would he be willing to accept compulsion with respect to industrial disputes.

The changed attitude appeared, too, in the proceedings of the convention. All of the old quarrels were dropped, excepting jurisdictional disputes. None of the issues that have been fought over in the past even came up for discussion. Industrial unionism was forgotten. The general principle of eight hours by law for men was not even mentioned, but a resolution was adopted without debate favoring the extension of the Adamson law to cover all railway employes. Another resolution was adopted without debate urging a federal eighth-hour law for women and children. The old, bitter antagonism between conservatives and Socialists cropped out in the debate on the so-called patriotic resolutions, the assumption being that those Socialists who stood by the administration are Socialists no longer. But the Socialist sue as such was a negligible one.

It is not to be supposed, however, that there were no disputes or differences of opinion in this convention. There were, and it is an interesting fact that on subjects not directly related to the wat there was a certain tendency to vote against the administration. In a controversy, for example, between the Central Federated Union of New York and the White Rats Actors' Union in which the Gompers influence appeared to be on the side of the Central Federated Union, the convention almost to a man sided with the White Rats. President Fitzpatrick of the actors made a speech an hour and a half in length in which he scathingly excoriated the officials of the Central Federated Union, to the manifest delight of the convention.

### The "Autocratic" Mr. Burleson

IN ANOTHER resolution that the committee to which it was referred tried to sidetrack, Postmaster-General Burleson was denounced for his attitude toward the unions of postal employes. The resolution described him as an autocrat and directed the Executive Council to endeavor to secure an audience with President Wilson in order to lay before him the grievances of the postal employes. President Thomas F. Flaherty of the National Federation of Post Office Clerks, and delegates from other unions of postal employs, took the floor on this resolution and so completely won the delegates over to their point of view that the committee was voted down and the resolution adopted.

In other and minor matters action was taken that was not in accordance with the program. The thing that has aroused the most comment, however, was the defeat of John B. Lennon as treasurer, a position he has held for twenty-eight years. The treasurer are differences of opinion as to what this really signifies, but it is generally accepted as a set-back for the Gompern

régime. The most singular feature of the situation is the fact that Lennon is in many respects the most progressive member of the Executive Council, while his successor, Daniel J. Tobin, president of the Teamsters' Union, is generally considered an ultra-conservative. Some of the radicals who voted for Tobin explained their vote by saying that they didn't care whom they elected if only they could make some inroad on the solid ranks of the Executive Council, the members of which have for years for the most part been reelected at every successive convention.

### Labor's Peace Terms

This most important expression of the convention, naturally enough, related to the peace terms and the peace conference, which will eventually meet. The Executive Council, in its report, after urging that there must be "adequate and direct representatives of the wage-carners among the plenipotentiaries sent to the Peace Congress," offerd "the following declarations as the basis on which peace must be negotiated":

- The combination of the free peoples of the world in a common covenant for genuine and practical cooperation to secure justice and therefore peace in relations between nations.
- Governments derive their just power from the consent of the governed.
   No political or economic restrictions meant to benefit some na-
- tions and to cripple or embarrass others.

  4. No indemnities or reprisals based upon vindictive purposes or
- 4. No indemnities or reprisate based upon vinceive purposes of deliberate desire to injure, but to right manifest wrongs.

  5. Recognition of the rights of small nations and of the principle.
- "No people must be forced under sovereignty under which it does not wish to live."
- No territorial changes or adjustment of power except in furtherance of the welfare of the peoples affected and in furtherance of world peace.
- In addition to these basic principles which are based upon declarations of our President of these United Stares, there should be incorportated in the treaty that shall constitute the guide of nations in the new period and conditions into which we enter at the close of the war the following declarations, fundamental to the best interests of all nations and of vital importance to wage-earners:
- No article or commodity shall be shipped or delivered in international commerce in the production of which children under the age of 16 have been employed or permitted to work.
- age of 16 have been employed or permitted to work.

  2. It shall be declared that the basic workday in industry and
- commerce shall not exceed eight hours.

  3. Involuntary servitude shall not exist except as a punishment for crime whereof the party shall have been duly convicted.
- 4. Establishment of trial by jury.

These declarations were adopted by the convention, practically without change. In addition it was proposed that, hereafter, the different governments, besides having diplomatic representatives now accredited to the various capitals, exchange labor representatives so that there may be adequate representation of the people of every country.

The convention endorsed woman suffrage and adopted the resolution on the federal amendment. It demanded for women the same pay as men when doing the same work. It provided for a special Negro organizer to work among the colored wage-carners of the South. Two resolutions were adopted charging Postmaster-General Burleson with suppressing papers devoted especially to the interests of labor and protesting against such acts, declaring that they were contrary to the constitution of the United States.

One of the most interesting and constructive of the things done by the convention was the adoption of a report of the special Committee on Cooperation, which was appointed as the result of a resolution adopted at the Baltimore convention last year. The report endorses the Rochale plan of cooperation, and proposes that a "qualified trade unionist cooperator be appointed by the president of the American Federation of Labor to serve one year as Jecturer and adviser on the practical work of Rochale cooperation." It proposes that this repre-

sentative shall visit localities where cooperative societies have been formed, or are about to be formed, and give information and assistance for the formation of such organizations. It was proposed that every local union in the American Federation of Labor contribute one dollar toward advancing this cause. In a lengthy statement the committee set forth the purpose of cooperation and the arguments in its favor, stating that "it is just as essential that a working man should get ren dollars" worth of actual value for his wages when he spends them, as it is that he should get the ten dollars that he is entitled to for the labor he performs,"

The most interesting thing about an assembly, whether of labor men, capitalists, church men or any other, is not so much what it does as the more or less unconscious revelations from time to time of human motives. The Buffalo convention of the American Federation of Labor was no exception. A resolution was introduced providing for a national charter for stenographers and office workers. In different parts of the country there are quite a number of local stenographers' unions affiliated directly with the American Federation of Labor. The ones with the largest membership of office workers are composed either of government employes or of the members in the offices of the headquarters of the unions themselves; consequently, there are fair-sized locals in Washington, Chicago and New York city. There is one in Indianapolis where a half-dozen international organizations have their headquarters. At the time when this resolution came up for action, an individual member of one of the office workers' locals, without conference with his fellow delegates, distributed through the convention a circular containing a severe attack on Frank Morrison, secretary of the American Federation of Labor, and charging him with dealing unfairly with the members of the local who are employed in the office of the fedcration.

#### Welfare Work in the Bricklayers' Union

THE reaction to the resolution and the circular was very interesting. The delegates, specially those who were officers of international unions, did not feel that they were dealing with a union of coordinate rank—they were employers who were confronted with a proposition from the union of their own employes. So they acted and talked just as employers do. William Dobons, secretary of the Bricklayers' International Union, remarked "the employes of the international organizations have no need of a union." He stated that they have short hours, good wages, and that, so far as he was concerned, "I go around every morning and speak to the employes, say good morning, and if any of them are not feeling well, I send them home."

Dobson was very indignant over the artitude of the stenographers' union. He said that because their employers are union men, they think they can hold them up. "I for one," he told the convention, "refuse to be blackmailed." The convention saw the matter in the same light as did the international officials, and refused a charter to this importinent organization.

Another very human reaction was the evident pride of achievement because of the great increase in membership, and other evidences of the strength that has come within the past year. Not until the year 1914 did the membership of the American Federation of Labor pass the 2,000,000 mark. It dropped below it in 1915, and in 1916 was some 72,000 in excess of that number. The membership reported to the Buffalo convention was 2,371,434—an increase of nearly 300,000 members in one year. There are very striking cases of rapid increases on the part of many of the unions. It was evident

on every hand that delegates felt the present to offer the greatest opportunity for the extension of unionism in their entire history.

In this connection, the change that was agreed to in the date for the annual convention is of interest. Hereafter it is to be held in June instead of November. While this does not, in all probability presage the formation of a new party, as some have suggested, it does have political significance. It means that plans will now be made before election, instead of afterward. It suggests the possibility of increased political as well as industrial activity, as a result of the recent gains in membership.

Perhaps it was because of the sense of security which such a situation had engendered; perhaps it was the bewildering effect of the rapid changes and developments in industrial conditions and problems since the beginning of the war-but, whatever the cause, the convention failed to deal with the large problems that have developed since the last convention in a large and statesmanlike way. Nothing could be more deplorable than the haste with which some matters of very great importance were disposed of, and the waste of time on other matters of relatively little importance. There was so much discussion in the earlier days of the convention that on the last day important business was rushed through without much consideration. A resolution that was adopted on the last day by unanimous vote, without debate, and without even being read in its entirety, recommended that any federal judge who declares a law unconstitutional shall thereby forfeit his office. On the other hand, the discussion over the stenographers' union occupied practically all of one afternoon's session and a considerable part of the evening session which followed.

# Jurisdictional Fights Banned

THE attitude of the convention toward strikes was not on a par with that of some of the international unions. Andrew Furuseth, on the floor of the convention, scornfully accused his fellows of patriotic "lip service." Such a characterization would have been clearly inapplicable at the convention of the Building Trades Department of the American Federation of Labor, which met just before that of the federation. It is the building trades which are cursed beyond all other industries with jurisdictional disputes and strikes. It was agreed in this convention of the building trades that there shall be no more strikes over jurisdictional matters throughout the duration of the war. Instead of that, whenever a jurisdictional dispute arises, the presidents of the two international unions involved shall immediately be notified and the union which is engaged in doing the work is to be permitted to continue without interference. The protesting union will not call a strike. The presidents of the two unions involved must go to the scene of the trouble and endeavor to adjust it. If they fail, however, to come to an agreement, the matter is to be referred to the president of the Building Trades Department, who has the final and deciding voice.

The coal miners, too, are cooperating with the government in every possible way to prevent a stoppage of work. When the fuel administrator, Harry A. Garfield, agreed some weeks ago to an advance in the price of bituminous coal in order that the wages of the miners might be increased, he stipulated that in the wage agreement then to be signed a penalty clause should be inserted providing that there should be no strikes or lock-outs throughout the term of the con-

tract and providing a fine of one dollar a day to be assessed against miners who strike despite the agreement, and an equivalent penalty against any employer who locks out his men. This agreement has been accepted by the United Mine Workers and they are doing everything in their power to get the local unions to accept it.

### Need of a Constructive Program

THESE are encouraging signs. But they represent a tendency that is by no means universal. No program was adopted or considered by the Buffalo convention looking to the elimination of strikes during the war. Many of the delegates were outspoken in their determination that the right to strike should not be curtailed even by inference. On one of the last days of the convention a resolution was adopted setting forth very clearly and excellently the necessity of cooperation between employer and employes for the encouragement of production. It pointed out that organization is necessary on the part of employes as well as employers if such cooperation is to be made possible, and it laid it down as "fundamental" that the employers should meet and deal with representatives of the employes. So far as the strike is concerned, the resolution contained this statement: "It is advisable that production should not cease because of an apparent injustice or oversight contained in an award, for it is necessary to a nation's protection as well as to the welfare of the trade union movement that there should be no cessation of work except as a last resort." This is, of course, no more than a pious expression of opinion.

The scarcity of skilled men in certain trades was considered by a committee on the "alleged labor shortage" and in its report it denied the existence of any important difficulty due to lack of men. It pointed out that thousands of union members are now out of work on account of seasonal fluctuations. It stated that the carpenters will in a short time have several thousand men available because of the completion of the work on the cantonments. Insufficient housing accommodation was cited as a reason for an inadequate labor force in some instances. The situation has been aggravated also by an exaggeration of the number of men wanted in any given place, indefiniteness as to the time when men would be wanted and repetition in advertising for men. Another reason for an apparent labor shortage was said to be the fact that men are now refusing to work under bad conditions. While there was much truth in the report of the committee, it seemed unfortunate that they were willing to let it go with a mere statement that there is no shortage, and offer no constructive plan for meeting the difficulties that actually do exist.

A further evidence of the failure of the convention to deal with the difficult problems which are pressing for solution was its action regarding the increased numbers of women who are entering industry. They called for equal pay for equal work, but they took no measures whatever looking to the organization of these women so that they might be in a position to demand equal pay.

The impression that has gone abroad concerning the patriotism of the delegates to the thirty-seventh annual convention of the American Federation of Labor is, I believe, a correct one. Labor is patriotic, but its patriotism is like that of nearly everyone else. Most of us are patriotic at heart, but we seldom are willing to make anything less than, a supreme, sacrifice for our country. It doesn't seem worth while. Short of that we go about our business in the usual way.

# Girls and Khaki

# Some Practical Measures of Protection for Young Women in Time of War

This article is based upon an institute conducted at the New York School of Philanthropy by Maude E. Miner, chairman of the War Department's Committee on the Protection of Girls. The institute aimed specifically to train experienced women to be protective officers in cities and towns near militure cantonments and camps. Following it, the article written by Winthrop D. Lane, of the Survey staff, aims to outline a definite program for both communities and workers?

FEW weeks ago a neighborhood association in New York city gave a dance for members of the National Guard and men drafted to serve in the new army, care was taken to invite enough girls to equal the party, the men of the draft army spent the evening in corners and along the walls, while the guardsmen received all the smiles, dances and promises of knitted sweaters. The guardsmen were, of course, clad in their trim suits of khaki, while the men of the draft army wore only civilian clothes. Such is the elamour of the uniform.

This glamour today is felt everywhere. It is causing flutters of emotion in thousands of feminine hearts ordinarily calm and impassive. Doubtless there are strong minds, like that of Madame Necker, who can gaze all evening at generals in their spangles without even a quickening of the pulse, but these seem to be the exceptions. A soldier's uniform has an appeal far stronger than that of a policeman's, elevator boy's and that of the pompous official who will not let you see your mayor until you have taken several oaths and sworn to an affidavit. It suggests fighting, and the defense of one's home and country. Each wearer is a possible hero. He is going to see strange lands and may do brave things. The newspapers tell glowing stories about him, and the public reveals an attitude of praise and respect that is contagious. What he wants is acknowledged to be more important than what other men want, so that kindness to him becomes a sort of patriotism. Withal, he is a bright, mesmeric figure in the dull texture of our lives and quickly touches the romantic sentiments and thoughts of girls.

To counteract the effect of this glamour is one of the most pressing tasks thrust upon us by the war. To see how pressing this task is, it is only necessary to visit the cities and towns near the places where soldiers are assembled in camps and cantonments today. It is to these cities that the soldiers go for amusement in their hours off duty. When you visit such a town, walk along the streets and count the couples of khaki-clad escorts and their companions; enter the movies, and see how many you find there; stand on a busy corner and watch the meetings between soldiers and girls who have never seen each other before; go to the dance halls and ask the proprietors how many men from the encampment patronize their places and what results from it; visit the localities where secret

The lectures were given by the following specialists in the various subjects discussed: Mande L. Miner; Mrs. Henry Microwitz, charman of the Committee of Protection of Cirks of the Major's Committee of Women, New York city; Arhair W. Colliders, Browleys; Ord G. Baker, secretary of the Traveler; And Society, Californ, Mrs. Colliders, Browleys; Ord G. Baker, secretary of the Traveler; And Society, V. W. C. A.; Mahelir Black, secretary Buston Society for the Care of Given of Committee of Commission, New York of Commission,

meetings can most easily occur, and see what you find there. But do not stop at this. Take a trolley to the town's amusement park, if it has one. Skip the well-lighted parts and visit the outskirts, where darkness or semi-darkness is a shield to conduct. You will find these regions alive with men in uniform accompanied by girls.

Now go back to the town and ask a taxi-driver how business is. If he is loquacious, he will tell you that it is thriving. He will tell you of trips to lonely places with girls and soldiers, and how remunerative such trips are. This is one of the forms of clandestine love-making that has become most popular since the war. The soldier cannot pay a high taxi charge, but he does not have to. The driver makes the price low in the hope of getting one or two rich "fares" in the course of an evening; a slightly intoxicated man is often good for a neat sum. The banishment of all "houses" from the camp zones partly accounts for the increase in this traffic.

Now go out to the camp itself. Spend a day in its vicinity. If it has a stockade, walk or ride around the outside of the stockade at dusk and in the early evening. You may see nothing. Much will depend upon the openness of the surrounding territory and the strictness of camp discipline. If the camp is surrounded by woods, you will be very likely to see soldiers accompanied by girls approaching or going away from the camp in large numbers.

These things will give you material for thought. The social hygiene problem created by this war is not a problem of commercialized prostitution. Segregated districts, disorderly houses and professional women have been very largely removed from the cities and towns near our training camps. It is a problem of the individual soldier and the individual girlement and the man cut away from his ordinary amusements and social life, the girl responding to the unusual and romantic glamour of the uniform

It is a widespread as well as a pressing problem. There are a million and a half men in training or soon to be in training in the United States. Troops for the new army are being trained in sixteen different cantonments. As many concentration camps exist for the National Guard. These thirty-two places are scattered through twenty-three states; they have from a few to fifty thousand men superimposed over night on the community's recreational and amusement resources. In addition, there are fourteen reserve officers' training camps, twelve aero training stations, and sixty-five naval stations and marine barracks. All these are exclusive of the 183 posts and stations of the regular army and of the camps where new increments will be formed for the regular army. Almost every part of every state has, on a larger or smaller scale, its task of protecting girls from the excitement and thoughtlessness produced by the emotions of war playing upon the emotions of sex.2

236

<sup>\*</sup>A list of the army and national guard camps will be furnished on request by the War Department and a map of the United States showing their location has been published by the Union Pacific Railroad Company.

Rumors exaggerate the evil. Some of these have been run down and found to have a very small basis in fact. Early in the war a story was spread that fifty girls were pregnant in the vicinity of an eastern aviation camp. The tale was traced to a woman who denied ever having made such a statement, and no evidence of its truth could be found. Similar stories of other camps have gained wide circulation. Some of these grew by repetition until they became ludicrous; soldiers were declared to have become fathers in large numbers in spite of the fact that they had been away from home for only a few months.

Every interruption to normal life in a community is the occasion for false rumor. Each earthquake or flood is magnified in the early reports until the death toll is many times greater than the actual number killed. Of course, the danger is real enough to justify elaborate precautions, but the psychology of irresponsible gossip has made it greater than the facts yet warrant.

The task is essentially two-fold. It centers around its two main characters—the soldier and the girl. The one must be supplied with normal, interesting and wholesome amusement and relationships inside and outside the camp, the other must be protected against the unusual atimulus to her enotions, and must be given vivid interests that will occupy her time and at the same time be a nexpression of her patriotic spirit.

Nearly everyone knows something of what is being done for the men in camp by the War Department's Commission on Training Camp Activities, of which Raymond B. Fosdick is chairman. Joseph Lee described important features of this work in the Suxwey for October 6. Less has been published about the Committee on Protective Work for Girls which Maude E. Miner, secretary of the New York Probation and Protective Association, is chairman and which consists of Martha P. Falconer, of Philadelphia; Mrs. John D. Rockfeller, Jr., of New York; Mrs. James Cushman, chairman of the War Work Council of the Y. W. C. A., New York, and Mrs. William Dummer, of Chicago.

This committee, the office of which is at 130 East 22 street, New York city, aims to secure increased facilities for the protection and care of girls in cities and towns near which camps are located. Its representatives have already visited many of these places and are visiting others. They are investigating local conditions and holding conferences with local agencies that can be of service, with local judges, chiefs of police, sheriffs, probation officers and the military police at the camps. The committee is trying to educate communities to the need of protecting their girls, and to assist them in organizing effective methods for doing so. It aims to work through existing agencies; instead of assuming responsibility itself for the things that ought to be done, it hopes to stimulate local groups to do these things. Only in this way can there be any permanent gain to the consciousness of a community that its social and civic life needs constant scrutiny in the interests of its young men and women.

### Policewomen as Prevention Officers

ONE of the greatest needs of the city or town frequented by soldiers in their leisure hours is one or more sympathetic, experienced women with police powers to patrol the streets, discover conditions that need correcting, supervise amusement places, aid in locating runaway girls, follow and warn young girls who are in danger, assist in the enforcement of law and befriend girls whose home life does not give them guidance and protection of the right sort.

Every camp community ought to have a girls' protective bureau for this purpose. There should be a director in charge of the bureau with two or more women protective officers under her. The bureau should be under the regular police department or under a volunteer committee. All the towns in the vicinity of a camp may well join to create a single bureau, and the number of protective officers will depend upon the number and size of the cities and the size of the camp. In addition to the paid protective officers, there should be volunteer patrols to supplement their work.

### Scouting in Advance of Trouble

THE kind of scouting activity which these officers should do is well illustrated by the following incidents taken from the report of a protective officer in an eastern city:

I noticed two young girls with a civilian and two saliors near an armory sitting on a step under the fire-scape at —— heater, which is closed for the summer. A vacant house is next to the heater. The girls were acting in a manner to draw the attention of passcraby. I watched them for some time. Then the civilian left and went up the sairway into the vacant house. He was soon followed by one of the soldlers, who in turn was followed by one of the soldlers, who in turn was followed by one of the soldlers, who in turn was followed went up the girls. Then both the other girl and the second soldier went up girls standing close against the wall, clasped tightly in the boys arms in the darkness.

They all had a stumed look when I called the girls said, and the boy insisted that I 'had nohing on them' but stepped ousside. The girls' faces were scarlet, and they willingly and quickly gave me names and addresses which I knew were fictious. They said the soldier was a cousin, and they had come to tell him goodby. On cross questioning, they became so confused that they denied half they had told me. At this juncture, one of the soldiers came in and told him the girls had been jung to me and I was going home with them to get the truth, unless they told me. He advised them to tell me; said he was not related to them, had only known them three days ('pick-ups'), but he didn't want any trouble. The girl who ad done all the talking then gave me another name, which I knew had done all the talking then gave me another name, which I knew the truth. I won't believe you unless there boys step outside get the truth. I won't believe you unless there boys step outside get the truth. I'm 'They broke down then, and told me as follows:

The leader, Helea White—17 years old law June—has been an orphan for nine years, and lives with an anu and an older sister, at — East — street. The aunt does work by the day—washing, etc. Helen works at — store, and they were on their way home from work. The other girl, Enther McGuinness, — East — street, is 17, works at — 's in the underwear department, and attends the Catholic church on — street. Helen is a Proterwant, and does not attend church. Both girls begged that they should not to their chivalry, they said, "We will try—but we are only human." I sent the girls home. They need to be interested in something.

At ten minutes of eleven I saw a small girl walk in front of the armory. She spoke to the guard and then went on. The guard looked at the other soldiers there, said something, then walked panigly toward the girl, whistled, and she stopped. He walked up and spoke. She turned, walked back to steps at end of armory and the same that the sa

The protective officer does not try to make a record of arrests. She is interested in preventing crime and helping girls and, of course, has no ground for an arrest unless law has been violated. Her personal work with girls should be somewhat of the nature of constructive case work. She should learn what she can of the girl's habits, tastes, work and home life. She should interview the parents and assure their interest in their child's welfare. Close cooperation with a juvenile protective association or other organization dealing with girls should be established. Many girls may be referred to patriotic leagues and other girls' clubs.

Protective officers will be surprised to learn how often they can establish sympathetic relations with the soldier, sailor, or civilian, who has been responsible for the trouble or temptation confronting girls. Often before she has ceased talking to him, he becomes ashamed of the part he has played. "If there were more women like you doing this sort of thing," said a sailor to one protective officer, "it would be better for the girls, and better for us sailors, too." "If the mayor is doing this," another remarked enthussatically, upon being told that the officer was working for the mayor's committee of women in an eastern city, "I'm going to yout for him."

### How to Get Clean Amusement

THE protective officer can be of great assistance in keeping the commercial amusements of a town clean and wholesome, though this task ought not to be left entirely to her. The path of the soldier on his furlough leads straight to amusement resorts. He secks out the dance-hall, the cabaret, be burlesque show and all the other forms of profitable cutertainment waiting to welcome him. The proprietors of such places are out for business. They are perfectly willing to run clean places if they can make as much money that way. To them the soldier is an opportunity for profit, and they will do all they can to make their places attractive to him. Moral results must contend with business advantage in their philosophy. If obscene burlesque shows, suggestive cabarets and loose dances pay better, that is what will be provided unless the community takes a hand and prevents.

The job of securing wholesome amusement in a town is not a new one. It is intensified today by the concentration of a great many young men in one neighborhood. One way of improving existing places is by law enforcement; another by the effect of public opinion. If good laws are not now in effect they ought to be passed. The community should see to it that each of its public amusement places is required to obtain a license, and that an officer is stationed at the door to keep order. The mayor should be the licensing authority, and the license should be revoked when the place is not properly run.

In Cleveland, whose dance halls are models for the country to copy, young police recruits are stationed at the doors of the halls; the record of order which they succeed in making determines in part whether they are given commissions. Liquor, of course, should be eliminated from the dancing room. This is a difficult undertaking, for the sale of liquor is the dance-hall's greatest asset. Here again Cleveland has set a good example which some other cities have followed; although she has not been able to prohibit altogether, she has forced the bar to be moved to another floor of the building in which the hall is located. The regulation proscribing the selling of liquor to a man in uniform is, of course, of great assistance in this matter.

A coarse burlesque show may have a tremendous effect upon the standards of a young recruit, especially one fresh from the country. The women in the show seem to him full of flash and snap. He wants the girl that he goes out with to be as snappy. If the men attend such a show one night and then are thrown with strange girls the next day there is likely to be trouble. The girls are anxious to please the men and shape their conduct accordingly.

Volunteer supervision can be made an effective way of influencing proprietors, especially in communities where law enforcement habitually lags. A proprietor instinctively straightens up when he knows that he is being watched. The best procedure is to organize a committee of respected citizens whose members will visit places of amusement every

night. Let them give the managers to understand that they will use their influence to boycott undesirable places. They can do this by spreading word among mothers in churches and clubs and among girls in young people's societies. Often they can express their approval or disapproval through the local newspapers, and this is a powerful weapon. They ought to encourage the good managers, and get business for them, not merely take the negative attitude of censuring the bad. A smart manager welcomes this sort of help because he can use it in his advertising.

The girl herself can be appealed to also. She it is who often sets the tone of the amusement resort, especially the dance-hall. An appeal to her vanity will sometimes persuade her that decent dressing and dancing make her more attractive to her partner. Exhibitions of good dancing are effective ways of setting the standards for dance halls. Young girls of fifteen to eighteen years of age should be kept out of public dance halls. They should be guided to some other form of amusement. Prevention is often a matter of not giving the opportunity.

The moving picture may be almost as demoralizing as the coarse burlesque show. This is not likely to be true in cities where only pictures passed by the National Board of Review of Motion Pictures are shown, but a good many cities get other pictures. The Affiliated Committees for Better Films. with headquarters at 70 Fifth avenue, New York city, will cooperate with communities in securing better pictures. Beloit, Wis., a city ordinance gives the mayor power to have any picture exhibited to him before it is publicly shown, and he may prohibit it if he sees fit. A committee of women have secured from him the privilege of viewing any advertised film that they are suspicious of, and recommending whether it shall be suppressed. Wilkes Barre, Pa., depends very largely on appeals to the managers of the motion picture theaters. A committee of women make it a practice to drop in at the theaters two or three times a week, and let the managers know that they are ready to help them get business if only good pictures are shown.

### Girls Organized to Help Girls

IN NEARLY every community it is possible to organize girls into groups with the two-fold purpose of keeping their minds and time occupied and of enabling them to be of service to others. The Y. W. C. A. is organizing patriotic leagues in many cities near camps, and these leagues give dances, hold club meetings, enroll girls in Red Cross classes and home economics clubs, and aim in many ways to appeal to the normal wholesome desires of young girls. There is no limitation of race or creed upon the girls who may join. In some communities this work is being done by other organizations; in Massachusetts the Women's Patriotic League Committee is doing it.

In organizing such groups too much cannot be done to get grits to help girls. A young girl was found selling pinks on a street corner in an eastern city. She was fifteen years old and very attractive. A worker of the Patriotic League Committee asked her why she was selling pinks, and she said she belonged to a "rosebud club" that was trying to help an institution for the bilnd. The institution declared it had never heard of the rosebud club. Nevertheless, the girl and two riends had actually given themselves that name and were eager to be of service in some way. They were making a great deal of money, having taken in over \$100 on July 4.

The worker gained the confidence of the girl and discovered that she and her companions had been accosted many times by men, some of them soldiers, who had offered the girls money if they would go with them. The girls were distressed over this and wanted to know if there wasn't some way in which they could help to prevent such occurrences. The worker suggested that they and their friends form a club. So fifteen of them formed a protective league, which has since grown and now investigates conditions in the city and reports on those that are a source of danger to other girls.

Another girl, in the same city, went for a stroll one evening in a public park. A policeman, thinking she was there for an immoral purpose, took her name and address and then insisted upon taking her home. Her parents believed that she had done wrong and punished her by shutting her up in a room by herself. The girl had gone out only for amusement. Her experience, however, gave her something to think about, and when a worker suggested that she form a club among her friends as a protection to girls, he readily accepted the idea and is now the leader of a group of girls in that town who have alterady done a great deal to improve conditions.

In enforcing the law the protective officer can again be of assistance, though hers is only part of the responsibility. A community should see to it, first, that its laws for the protection of girls are adequate. Those respecting the licensing and control of amusement places are important. There should be an ordinance providing for the lighting of parks and streets, and for sufficient police protection in outlying districts. The method of dealing with girls and women in the courts should be improved, if necessary; probation officers should be attached to the court and a matron placed in charge of girls at the jail.

It is also extremely important to have a house of detention separate from the jail for the confinement of girls below sixteen or eighteen years of age. The age of cousent, which is ten years in some states, should be raised to eighteen, and laws regarding abduction and criminal assault made adequate.

When girls are found violating the law they should be taken into custody by either a protective or a police officer. Effort should be made to win the confidence of the girl, and if a man has committed criminal assault, or any other crime against her she should be induced, if possible, to tell the truth about him. The man should be forthwith reported to the proper authorities. Whether these will be the civil authorities or the military authorities at the camp will depend upon local conditions, and upon which is more likely to take effective action; there is no law taking offenses of this sort by soldiers out of the hands of the civil authorities.

# Some Points of Law to Remember

PROTECTIVE officers should not be content, however, merely to report the man. They should follow the case up and see that justice is administered. For this reason all who are concerned in shelding girls from the dangers incident to the proximity of training camps should early establish cordial relations with the law-enforcing authorities. Cooperation with them is essential to an aggressive policy of protection. It is also wise to get in touch with the central authorities, the automey-general of the state, the United States district attorneys, and the Department of Justice at Washington. A good effect is often produced on officials who know that they are being watched. A panic has sometimes been created in the office of a local official by the mere knowledge that a letter from Washington has been received by some one who is watching him.

There are certain things about the machinery of justice, the laws and the elementary rules of evidence that ought to be known by those who expect to have a part in law enforcement. A talk with a competent lawyer is the best way to learn these. A few general principles and facts, however, may be set down.

One of these is the meaning of the white slave traffic law, called the Mann act. This is a federal law, and prosecution under it is, of course, in the hands of United States district attorneys. The law provides that wheever transports in internsate commerce a woman or girl for the purpose of prostitution, or for any other immoral of this states may be by railway, by steambling or by any other conveyance. The United States Supreme Court has held (Caminette vs. The People, 242 U. S. 470-Jan. 15, 1917) that there need be no commercial element involved in the immoral purpose for which the girl was transported. Nor all prosecuting officials accept this deep the girl was transported. Nor all prosecuting officials accept this deep this act in such a case has the distinguished authority of the United States Supreme Court back of him.

Another legal fact of importance is that a man may be guilty of rape in the scond degree without using force to accomplish his end. This oftense is called 'earnal knowledge' in some states. The provision concerning it is the most liberal of all provisions to protect young girls; it protees them even against themselves. The girl may urise the ear, he may even fallely till her mad tempanion that the wind the state of the provision of the provisio

Seduction is prevailing upon a woman to commit sexual intercourse under promise of marriage. Prosecuting officials put up the red flag of caution when this law is invoked, because there are so many elements that have to be proved and because under it so many women bring false charges seeking revenge. There must be a definite and unconditional promise of marriage, the woman must be unmarted and of previous chaste character, and she must have relied made after the act it has no value.

Made alter the act it mas no value.

Abduction is committed by anyone who "takes, harbors or uses a female under eighten years of age for the purpose of prostitution, or, not being her husband, for the purpose of sexual intercourse, or, without the consent of her parents, for the purpose of marriage! This crime can often be detected and punished before the girl has actually been injured and protective officers may well be on the lookout for it.

A law that has been used in many states in recent years is the abatement and injunction act. This declares that any place in which prostitution is conducted is a nuisance and that the district attorney of a county or any trapper in the neighborhood may bring an action perperually to enjoin such nuisance. It has been made a very effective one, on it some states and could be made a vitil more effective one,

There are certain rules of evidence that have almost the force of law. One of these relates to corroboration and amounts to this: that no conviction in sexual crimes can be had upon the testimony of a woman unless this is supported by other evidence. In New York this is a legal requirement; it is a practical necessity everywhere when you appear before a magistrate or jury to ask for a conviction. There must be something besides the testimony of the girl to set against the denial of the man. This need not always be another witness; anything that will commend itself to a reasonable person as substantial corroborating testimony is usually sufficient. If the man and woman are found in a rooming house, for example, and the landlady testifies that they came as man and wife, that is usually enough. Another kind of corroboration is an admission from the accused person of the fact in issue. This need not be a conscious admission of guilt, but may be a fragmentary statement thrown into a conversation about another matter, a sentence in a letter, or a remark to a third person.

In obtaining confessions of guilt it is important to remember that the confession must not be secured by putting the accused in fear or by means of threats. In such case it will not be received in evidence. A confession obtained by an agreement with the prosecuting effect that the individual will not be prosecuted cannot be used against him. Confessions are often easier to obtain than one imagines. They need not be obtained in any formal way, may be either oral or written and may be made to any intelligent person.

A rule of very practical importance for persons in investigative work is that which permits one to "efferth" his memory on the witness stand. If you take the stand some months after a thing happened and your memory of details is not clear, the court did allow you to refer to your memorands or notes jotted down at the time and to use these in giving your testimony. It is important, the standard of the property o

Nearly everyone understands that hearsay evidence is not ad-You cannot go on the stand and say that you heard John missible. Smith say that he saw the defendant act so and so. Perhaps John Smith would not make such a statement if he were on the witness stand and under oath. Hearsay evidence lacks responsibility.

A practical suggestion of value to investigators is the disadvantage of acting too quickly. Many cases are lost through over-haste. This must not be interpreted to mean that one should wait until a crime has been committed and a girl ruined before interfering; it is better to lose the chance of prosecuting than to do that. the object is the actual detection of a person in the act of violating the law for the purpose of prosecution and punishment you will have the law for the purpose of prosecution and punisament you will nave to prolong your observation until the overt acts come within the provisions of the law. Another point in procedure is the value of prompt and persistent questioning of the accused. This is a legiti-mate form of the third degree. Confessions are frequently obtained in the last few minutes of a long, hard interview. You are perfectly justified in staying on the job until your persistence and moral strength overcome the persistence and moral strength of the person suspected of crime.

Many cities and counties fail to comply with a law in many states requiring that children under sixteen or eighteen years of age be held apart from the jail. If the county or city does not make provision for this during the war emergency, some volunteer committee or agency ought to do it. The associations and environment of the typical jail are bad for young girls. A house of detention should be established for them, and this should receive both city and county charges. To rent, equip and support such a house for the first year usually costs about \$5,000. Whenever it is possible to utilize some existing home as a house of detention, this should be done without establishing a new institution. In addition to such a house it is advisable to have also one or more emergency rooms reserved in a boarding house or private home, for girls who have not committed crime and merely need temporary shelter and care.

An illustration of the need for such rooms is afforded by the experience of two girls, sixteen and nineteen years old, who were arrested in an eastern camp city in July. These girls had run away from a small town in Vermont and had come to the camp city in search of work. They said they had lost their pocketbooks, though they had probably spent their money, and slept two nights on the banks of Lake Champlain. A policeman arrested them on the charge of vagrancy, and they spent four nights in jail. What this meant to the future and outlook of these girls can only be imagined. They were guiltless of any crime and should have been provided for in some friendly and sympathetic way. When a visiting worker found them, she discovered that no one except the police authorities knew they were in jail. She arranged for them to be taken to a club for young women which agreed to keep them until word was received from their homes, or until their mothers came for them.

#### Organizations That Will Help

CERTAIN aspects of law enforcement are being handled by the Commission on Training Camp Activities. This commission is undertaking the suppression of vice and the sale of alcohol to soldiers, in accordance with sections 12 and 13 of the military draft law. It has a representative in the vicinity of every national army and national guard camp who is expected to carry on continuous investigations. The work of these representatives is checked by supervisors for given districts who also control the work in the smaller specialized camps. The machinery for gathering information includes also the field men of the Department of Justice, the intelligence department of the army, the local provost guards, and the staffs of such organizations as the National American Social Hygiene Association, the Committee of Fourteen of New York, the Committee of Fifteen of Chicago, the Watch and Ward Society of New England, and the Bureau of Social Hygiene of New York.

The commission declares in a report just issued that "red light districts" have been closed in the following cities: Deming, N. M.; El Paso, Waco, San Antonio, Fort Worth and Houston, Texas: Hattiesburg, Miss,: Spartanburg, S. C.; Norfolk and Petersburg, Va.; Jacksonville, Fla.; Alexandria, La.: Savannah, Ga.: Charleston, Columbia and Greenville, S. C.; Douglas, Ariz.; Louisville, Ky.; and Montgomery, Ala. New Orleans passed an ordinance which was expected to wine out its district November 15. A number of cities in which no districts were formally tolerated have, at the instance of the commission, abolished their open houses of prostitution.

In addition, the laws against vice have been strengthened in many cities at the suggestion of the commission's representatives, and the machinery for the enforcement of those laws has been geared up to a higher notch of efficiency. In California and Arkansas, State Military Welfare Commissions have been appointed by the governors, and executive secretaries have been appointed to carry on the work of vice repression.

### Five Points for a Community Program

THE program for each community may be recapitulated thus:

- 1. The creation of a girls' protective bureau with a director and women protective officers with police power under her. The salary of the director should be from \$1,500 to \$1,800, of the officers \$1,200. If the city will not pay these salaries some volunteer organization should. Volunteer patrols should be appointed in addition to the officers. The bureau should do the following kinds of work:
  - a. Scouting and patrol work. b. Supervision of amusement places.

  - c. Personal work with girls.
  - d. Aid in law enforcement.
- The securing of a house of detention for girls separate from the jail, and, in some places, of another place where girls not suspected of crime can be sheltered temporarily.
- 3. The appointment of a woman probation officer to learn the truth about and befriend girls arrested and brought to the courts.
- 4. The securing of improved laws, ordinances and regulations for the protection of girls.
- 5. Promoting educational work through lectures in churches, public schools, parents' associations, etc., and the stimulating of group and club work for girls.
- In most cities it is recommended also that a sub-committee on protection of girls be appointed by the local committee on camp activities; in some cities it will be found advisable for a committee or board to be appointed by the mayor to help in creating the pro-tective bureau, in establishing a house of detention and in securing the appointment of a probation officer. This committee could seek to carry on the above program and to secure additional facilities.

In addition to aiding in working out this program, the Committee on Protection of Girls is planning to carry on a wide educational propaganda by means of printed leaflets, lectures to mothers, conferences with camp officials, collection of data regarding character and extent of delinquency among girls in camp cities, and lectures to men whose cooperation is sought. The committee is training women to be protective officers and has sent a number of experienced workers to camp cities to fill positions; it expects to send more. Its aim is not alone to fill an emergency need, but to promote the intelligent handling of girls by every agency coming into contact with them, in the hope that this policy may be incorporated into the thinking and permanent practice of every community.

THAT nearly all the pictures shown at an exhibition are sold may seem a rare occurrence, even rare: if they are all sold to artists who know "what's what." When all the works thus sold are by children between seven and thirten years of age, we are amaxed; and when we learn that all these children are Negro, we gape. These, however, are the facts concerning a show of some thirty pictures sow on view at the Coady Galery, in Fifth avenue, New York, in aid of Negro war relief. "The Party." by P. W. Henderson (age 13), above reproduced by the country of the owner, A. B. Davies, in one of them. Color values, plasticity, driign—all the qualities admired in pictorial art are present. Robert J. Coady likes to play with children. When they are tired of games or restless, he places in their hands the materials for artistic self-expression, entirely eliminating his own individuality and not even suggesting how crayons or brushes are best handled. In spite of this—or perhaps because this art work never ceases to be play—the technical mastery acquired by many of these children is remarkable. In Mr. Coady's experience, News or children are more poste than white children. Hencuraged freely to develop their offits, they are likely to make vital contributions to western culture.

# Where Barrow Street and Bleecker Meet

# By Anne O'Hagan Shinn

AVE you a maiden aunt of the new school? She is not the pale pathetic figure of the old-fashioned romance, gratefully gathering up crumbs of affection from the family table. She views life through eyes bright with a sophisticated twinkle, not dimmed by renunciatory tears. Her words are flavored with a due proportion of salt and spice, and seldom recall that ancient, maiden-auntly favorite in ingredients, saccharine. But she is a maiden aunt. That is, a large connection of nieces and nephews know that they can depend upon her at a pinch. They are also aware, without further investigation, that many of their activities she would disapprove if she could bring herself to take them seriously; they know-and uneasily they try to force a contempt for her point of view-that she has not embraced all the very latest theories of art, literature, industry and personal and social conduct-at any rate she has not embraced them for the reason that has frequently seemed so allsufficing to her young relatives-because they are the latest. They know that she would no more cast overboard a serviceable set of conventions merely because someone had dubbed them "Victorian" than she would wear a hobble skirt merely because a convention of ladies' tailors had said the hobble was the "dernier cri in nobby ladies' wear." Yet, despite her critical twinkle and her annoying habit of being frequently right in her nice rejection of the latest novelty, she is an oldfashionedly helpful soul, the modern maiden aunt. She will lend her house for a dance and she will dig into her purse now and then to help tide over the financial difficulty with which the more immediate family has no practical sympathy. She will sit up with the sick more efficiently than her predecessor of the meek-banded hair, and she will manage to find the money for Nellie's course at the art school and Ned's new uniform.

And sometimes she goes forth to a great costumer and orders her a new frock. And behold—the most impressive, the most magnificent, person in the whole family group at the next gathering of the clan is the maiden aunt in her midnight blue velvet, with the diamonds that were great-grandmother's glittering in her hair.

Just at this moment, Greenwich House, lovely and stately in a new garment of Chester Aldrich's designing, seems to some of its old friends the impressive, mature, sophisticated maiden aunt of the antic set of Greenwich Village youngsters who surround her, experimenting with life, experimenting with freedom, pluming themselves mightily on being, as the advertisers put it, "different," The beautiful new house on Barrow street next Bleecker, might have been there when Barrow street was young and Bleecker street was fashionable, so perfectly does its chaste Georgian façade recall the dignity and hospitality of the older day. Its decorations, to be sure, might startle a resurrected Greenwich Village merchant of the elder time. The peacocks and bunnies, the gold "green" peppers, the monkeys and the elephants with which Messrs. Tack, Crisp and Savage have decorated the wall spaces of Mr. Aldrich are the Maiden Aunt's twinkling announcement to the studios which hem her in on every side that she, too, knows who is who and what is what in the decorative art field of 1917-or '18 or '19, perhaps-though she does proudly inhabit a house whose dwellers might, it seems, have listened to the town crier proclaiming the surrender of Cornwallis,

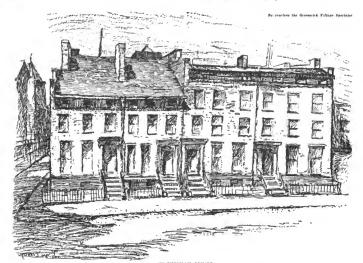

instead of the "yuxtry" announcing the triumph of woman suffrage. And there is no doubt that the medallions of Mrs. Harry Payne Whitney, which are to decorate the front of the building, will achieve the same note of modernity.

In the new, beautiful dwelling with its sophisticated touches of ornamentation, there will be certain activities which the shabby old houses on Jones street, around the corner, did not know. Not merely more theatricals-for now there is a stage and an adequate assembly room; not merely more gymnastic work, for now there is a magnificent gymnasium; not merely this or that old activity on an improved scale, but new activities which the new times have inaugurated. There will be a Red Cross workroom, there will be a war information service bureau, there will be more Liberty Loan meetings, there will be classes for the further Americanization of some of the new citizens created on the sixth of November and the civic instruction of others. For that matter, however, Greenwich House, like every other settlement, is a constant, living effort toward the Americanization of foreign-born settlers in the only way in which Americanization can be genuinely accomplished-daily intercourse and daily-and mutual!-assimilation of ideas and habits.

THE CIVIC CLUB

The men and women of the club, organized about a year ago
"to facilitate the consideration of social problems and the formation of groups for civic activities," have moved into a hospitable old house in West Twelfth street.

IN SHERIDAN SQUARE

The quaint center of Greenwich Village, with Greenwich House around the corner at the left, the Village Theater at the right. Old houses like these may be found in almost every neighboring street, fallen upon less prosperous days since they were the homes of Hamilton and Burr, Tom Paine and Edgar Allan Poe.

This mutuality in exchange of ideas, customs and benefits is one of the tenets upon which this settlement was founded. Before the historic day, sixteen years ago, when the moving van arrived in Jones street with the Simkhovitch baby, nurse and baby carriage aboard, that article of faith and action had been formulated. It was to be a cooperative settlement which was to be established, and its cooperators were to be the people of the neighborhood, the residents of the house and the "uptowners" who happened to be interested in the movement. The neighborhood was not to be regarded as a defenseless piece of dough to be kneaded into the shape decreed by the taste of the residents and a distant board of managers. The cooperation of the three contributors was essential to the plan. and this sane, democratic method has been followed throughout the history of Greenwich House. It is a system which, if not absolutely unique in the movement, is at least rare enough to justify mention.

The method on which the house is run is also democratic. It is, so far as its residents are concerned, a cooperative club. The house expenses do not form part of the budget of the association. The residents hire their housekeeper, their servants and pay for their provisioning on a pro rata basis.

What has it meant to the neighborhood in all these years, during which it has gradually expanded from its single old house on Jones into two or three, and finally into this new home? What has it given the Village and what has it received from the Village?

Well, it was instrumental in forming the Greenwich Vil-

lage Improvement Society in 1902, one of the earliest, if not the very first, of all the neighborhood improvement societies which have since dotted the city. It was that organization which, four or five years ago, conceived the Greenwich Village Old Home Week, one of the most successful efforts ever made to give a certain continuity to a shifting city neighborhood. Greenwich Villagers from uptown and out of town flocked to it; they exchanged reminiscences about old P. S. 45. They gave the newcomers in the region a sense of a fine, old, historical background. In this, as in everything else that has happened in Greenwich Village for sixteen years, the settlement and Mrs. Simkhovitch were foremost.

Yes, in everything. Even in all that has happened in that Greenwich Village which alone engages the attention of the Sunday papers, and which the older and staider residents of the section haughtily regard as the mere froth upon the milk pail-the Greenwich Village of the studios and the tea rooms, the gift shops and the home-grown drama, the experimentation in art and in life, in coiffures and in balls-artistic Greenwich Village. For it was George Ford, the architect, the expert in city planning, now engaged in reconstruction work in France, who saw, years ago, in his period of residence at the settlement, the possibilities of the region as a residence section. It was at a time when people were prophesying that residential life had finally passed the Village by, and that slums and warehouses were to be its portion forever more. Mr. Ford did not believe that, and when he was engaged with the City Zoning Commission he helped to make good in practice his

belief in Greenwich Village's residential possibilities. After which came the artists, and the little "Bohemian" publications, and—yes!—the "Latin Quartier" barbers and bootblacks.

Then, too, overflow population from the settlement was among the first of the "intellectuals" to seek shelter in the old houses on the old streets now perkilv remodeled. On Sheridan Square, where now, nightly, a line of motors waits before Polly's or The Blue Iay or whatever it may be, is an old house in which Walter E. Clark and half a dozen others, "outside" workers at the settlement, used to live. He was one of the most popular of the boys' club leaders, and his young charges of former days have always followed his career at City College with interest, and take a sort of personal pride in his recent appointment to the presidency of the University of Nevada. His wife, who was Effie Abrams, was, while she lived at the settlement, the first school-home visitor in the city. Greenwich House, from its inception, has always kept in the closest relation to the schools of the neighborhood. It was during the Old Home Week celebration, already referred to, that a public school building was used for the first time for a public dinner. That was in the days when the public school buildings were held as something sacrosanct in out-of-school hours, and were kept closed and shrouded in gloom. When one considers their all-year-long and their all-day-and-evening-long activity now, one is inclined to think that Greenwich House never did anything more valuable than helping to change that point of view.

If a tablet were to be erected to commemorate the service of Mary Simkhovitch and the settlement to the neighborhood, it might appropriately be placed in Hudson Park. It was City Councilman Walker who is affectionately known as the "father" of that breathing space of light and air and beauty down in the crowded lower West Side. But it is very largely due to Mrs. Simkhovitch's zeal and en-ragy that, grouped due to Mrs. Simkhovitch's zeal and en-ragy that, grouped

about the park there are, in addition to the public school, public baths and a branch public library, all of them delightful to the eye. It is a lovely civic center and an object lesson in the desirability and usefulness of such centers. And that on the roof of the public school erected here there is provision for open-air classes for backward and anaemic children is largely due to the settlement's efforts. Hudson Park has been, too, the scene of several of the charming pageants with which Greenwich House marks the Spring and induces in its young clientel the sprint of cooperation in play.

So it goes on. One cannot enumerate all its activities, past. present and to come-the work inaugurated by Dr. Hans Zinser and Nana O'Loan in combatting infant mortality; the work of the music school in promoting a musical appreciation in the neighborhood, the work of the new neighborhood art school to promote, through its classes in pottery, weaving and design, an art feeling; its investigation into the condition of the West Side rookeries which has led to so many of them being converted into Greenwich Village inns, studios and coffee houses; the multitudinous clubs and classes. It would be impossible to enumerate all of its graduates who are now serving other communities on the lines learned here. All that can be said, briefly, is this-that it is no institution standing apart from the current of life in the region it serves. It is a part of Greenwich Village-the Greenwich Village of the bizarre art and the bizarre festivities as well as of the Greenwich Village of the quiet, respectable, nice old houses and quiet, respectable, nice, old-fashioned workpeople and tradespeople, and the Greenwich Village of the tenement quarters and evil smells and tuberculosis records and all the familiar litany of the very poor. It has worked for them all, it has worked with them all. In the new house, where its activities -and its needs!-will be so much more than formerly, it will continue on its old principle of cooperation with all the neighbors.

# Problems of Social Relief in Russia

By C.-E. A. Winslow

PROFESSOR OF PUBLIC HEALTH, YALE SCHOOL OF MEDICINE, MEMBER OF AMERICAN RED CROSS
MISSION TO RUSSIA

MMEDIATELY after the creation of the War Council of the American Red Cross, plans were made for the organization of relief work for our allies through the medium of special missions to France, Russia, Rumania and Italy. The Russian mission was the second of these missions to be formed and left at the end of June with a personnel of twenty-mine and \$100,000 worth of medical and surgical supplies. The chairman of the mission was Dr. Frank Billings, of Chicago, and it included in its membership solt technical experts and sociologists as Dr. W. S. Thayer, of Johns Hopkins; Raymond Robins, of Chicago, if Prof. H. C. Sherman, of Columbia, and Prof. G. C. Whipple, of Harvard. as well as a group of business men and executives headed by W. B. Thompson, of New York city.

We found much that was encouraging in Russia, much that may keep one hopeful and confident even in these dark days of early November; and among the signs of promise none were more notable than the organized work of social relief and social reconstruction that goes quietly on despite cabinet crises and political unrest.

In the field of military affairs we found four great relief

organizations at work, the Sanitary Department of the army, the Russian Red Cross, the All-Russian Union of Zemstvos and the All-Russian Union of Towns. The achievements of the last two are particularly significant because it was these organizations, representing the best of liberal Russia, which before the revolution stepped into the breach and furnished the army not only with medical care but with the food and clothing which an incompetent bureaucracy was unable to provide.

We visited the factories and storehouses of these organisations in Petrograd and Moscow, and members of the mission studied their work all along the line to the front. They were operating on a tremendous scale and on the whole with high efficiency. The factory of the Sanitary Department of the army at Petrograd, besides the manufacture of an imposing list of drugs and instruments for the military hospitals, turned out 20,000 first-aid packets a day. I have seen few things more impressive than the meeting which I attended of the Central Evacuation Committee of Moscow. In a large high studded palace room finished in dark wood (said to be the seene of the wedding in War and Peace), this committee

meets every afternoon at six and with reports of train movements and hospital facilities for the whole of Russia plans the evacuation of the wounded from back of the line to the places where they can best be ultimately cared for. This one committee at Moscow has handled 2,700,000 sick and wounded men since the beginning of the war, and 1,300,000 more have been cared for through other local committees of a similar nature.

OUR first task, as a Red Cross mission, was to assist in this work of medical military relief. We found that Russia did not need foreign medical personnel, and that her hospitals were fully adequate. There was, however, great need of certain particular supplies—sera, drugs, instruments, microscopes—and through an American Red Cross bureau (to conduct which about half the members of our mission remain in Petrograd) these supplies are being furnished in regular monthly instalments. In order to avoid duplication and overlapping, the Sanitary Department of the army, the Russian Red Cross, the Union of Zemstvos and the Union of Towns formed a joint committee to cooperate with us in determining what articles were most needed and how they could best be distributed.

The relief of distress among the civilian population forms another very important branch of the work of our mission. Three years of war, followed by the social and economic disroganization incident to the revolution, have naturally produced their effect upon transportation and industrial life. Wages are very high, and in spite of mounting prices we saw few evidences of general destitution; but food and certain articles of clothing will be urgently needed during the coming winter. Russia has on the whole about enough food for her needs (though no enormous surplus such as has been imagined by certain writers). This is poorly distributed, however, and much grain is being hoarded by peasants who have more money than they care to spend at present high prices and will not sell grain at the relatively low price which has been unwisely fixed by law.

Curiously enough, the abolition of the sale of vodka has contributed to this end by cutting off one important source of peasant expenditure and making him still more prosperous and independent. In spite of this fact, however, Russia is a compelling example of the value of the elimination of strong drink. It would have been absolutely impossible for the first six months of the revolution to pass with such order and self-control if vodka had been within reach.

Local food shortages, then, are certain to be felt—are already being felt in Moghiliev, Smolensk, and other centers; while there will certainly be serious distress in Petrograd and Moscow during the coming winter. Meat, bread, sugar, milk, eggs and groats were all on card in Petrograd during August. Sugar it was almost impossible to purchase. The gravest deficiency was, however, in the milk supply. Petrograd in peace times had only one-ninth of a quart of milk per capita (onethird of an adequate allowance), and war conditions and disaffection in the Baltic provinces and Finland have cut the supply to one-thirtieth of a quart per capita. The sale of what milk was to be had was limited last summer to children under three years of age.

In connection with this problem we worked primarily with
the Ministry of Social Help, which is to exercise supervision
over all social agencies throughout Russia. This work was
under the guidance of an able and broad-minded minister, M.
Effremof, who was aided by Deputy Minister Golubkof and
two exceedingly able women, Mme. Polonsova and Miss Ogranovitch. The women of Russia are magnificent and will
save her if the men should fail. Miss Ogranovitch was a
delicate high-strung woman who had spent a good deal of her
time at Nice and Menton before the revolution. She is now
working literally twenty hours a day, in the Ministry of Social
Help, as president of the district duma in the Narvsky factory
district of Petrograd, as a member of the central city duma,
and as a visitor to a hundred children under the care of the
inventile court.

UNDER the auspices of this Ministry of Social Help, the first All-Russian Congress of Child Welfare was held while we were in Petrograd, and we were invited to discuss problems of child relief in war time. The program of this congress was a most ambitious one, covering parks, playgrounds, recreation centers, kindergartens, industrial education and every topic that could be discussed in such a gathering here.

The question of education is perhaps Russia's largest ultimate problem and has been attacked with vigor in the Ministry of Education. Here there has been worked out a comprehensive plan for universal compulsory education to be reached by successive stages in periods of five years, while the Countess Panine, another of Russia's brilliant and devoted women, is developing methods of extension work for the present adult population.

The members of the congress of child welfare—and particularly the members of the Ministry of Social Help—were

Food card in use in Petrograd during August. This card entitles the holder to two portions of each of the following commodities: Bread 16 times a month, fats 4 times, meat 4 times, sugar 2, eggs 4, greats 2, and flour once a month or 3 times in smaller quantities.

BREADLINE IN MOSCOW

naturally most vitally interested in the more immediate problems of relieving destitution during the coming winter. It is estimated that there will be more than 100,000 children needing relief in Petrograd during the coming winter and at least 5,000 totally destitute. The ministry believes that the care of children of school age is its most immediate emergency task. This it proposes to accomplish by the establishment of fourtee district feeding points and open-door night refuges where food, clothing, educational and recreational facilities may be furnished to children between 4 and 17 years of age. These stations are to be managed by the district dumas under the general direction of the ministry with a large central committee and a small executive committee representing the district and central dumas and the ministry in charge.

I HAD the privilege of visiting the first of these new feeding points in the Vyborg district. It was an imposing institution with a whole group of expensively equipped buildings which had been erected by a philanthropic noblewoman under the old regime and never really put to any use. There were 30 children at the time in an institution which could house 500 and feed several thousand. Russia is full of these undeveloped concepts of freakish aristocracy which democracy will know how to utilize to some purpose.

The officials of the Ministry of Social Help invited us to sit with their committees on this work and displayed a touching eagerness to avail themselves of American experience and American organizing ability. The All-Russian Congress of Child Welfare cabled to Washington a resolution of gratirude which closed with the sentence: "The people of Russia especially appreciate the possibility of a cooperation of our young democracy with free America, not only in a struggle for existence during this period of war, but also in the actual reconstruction of the new life of the future."

In a speech of welcome, one of the delegates said in English:

We incline to the faith that after having quite successfully resolved the immediate problems of your philanthropic mission, you will not stop. Our democracy is yet a child, a healthy one, being born in not stop. Our democracy is yet a child, a healthy, but still a child. She needs assistance and help from her deler steer, the great democracy of control of the problems of the property of the problems of the prob

The American Red Cross has planned to do its utmost to respond to this appeal. Raymond Robins, of Chicago, one of the members of our mission who remained in Petrograd, will represent America in cooperating with the Ministry of Social Help, and already a first instalment of a million pounds of condensed milk has started for Russia to help to feed the children of Petrograd.

The Ministry of Social Help is undoubtedly wise in deciding to devote first attention to the specially acute problem of children of school age. The problem of mortality among infants is, however, a very grave one and must ultimately receive the earnest attention of Russian social workers. One quarter of all the babies born die before reaching the first year of life (as against less than one-tenth in New York city). It is not the lack of breast feeding which is at fault, for breast feeding is general, but the giving with breast milk of other harmful foods and in general maternal ignorance and the interference with effective maternal care by agricultural and industrial employment of women. The remedy everywhere must, of course, be education through the medium of the baby clinic; and both Moscow and Petrograd have initiated admirable efforts along these lines. I have never seen anything finer than the infant welfare station at the Morosov Hospital in Moscow; and Petrograd has an excellent museum of infant welfare and a chain of well-organized baby clinics in which the moving spirit is Dr. S. Popova. The work must, however, be multiplied enormously when Russia can catch her breath and initiate constructive social work on a large scale.

When that day comes, the remarkable strides that have been taken toward the socialization of medicine will greatly facilitate the work of public health education along this and other lines. More than half the births in Petrograd occur in maternity hospitals, and the wonderful growth of zemstro medicine in the rural districts has firmly established the principle that medical aid is not a charity but a regular and necessary function of the state.

M OSCOW province, for instance, supports through its Zemstvos about one hundred hospitals, one for every 10,000 to 15,000 inhabitants. Each hospital has from twenty to sixty beds and an average personnel of two doctors, four medical assistants (Feldachers) and four nurses. Attached to each hospital is a dispensary, and all mediciues, as well as medical care, are free.

It is such things as these which make one believe that Russia lass the organizing ability and the social spirit to conquer her foes within and without and emerge as the greatest free people the world has ever known. As an American, I am proud of the faith and confidence in Russia which America is displaying in these dark days of early November. I believe that faith and confidence will be justified, and that the real Russia will emerge from the present crisis stronger than before and more than ever determined to win the war and overthrow the German despotism whose existence is incompatible with the true hopes of liberalism and democracy in Petrograd as throughout the world.

# Teaching Respect for Authority

# By Winthrop D. Lane

OF THE SURVEY STAFF

HE punishment of nine teachers in De Witt Clinton High School, New York city, tor acts smacking of an insufficiently robust loyalty to the United States, has become more than a matter of sedition in the public shobos. It is not explicable as only an adventure in disciplina. It goes deeper than either of these. On the one hand, it is the expression of a particular concept of education, and on the other it is a manifestation of the insistent demand by teachers for more participation in administrative and educational solicies.

Three teachers were deemed dangerous enough to be suspended without pay. Six others were transferred. The charges against the three, not yet tried, are reasonably specific. One is accused of not considering it his duty to develop in his pupils "instinctive respect for the president of the United States as such, the governor of New York as such, and other dederal, state and municipal officers as such." He is accused also of having permitted a student to read aloud in class a letter violently criticising President Wilson, and for failing to make such comments on the letter as would open the pupil's eves to its disloyatry.

Another teacher is accused of believing that patriotism should not be discussed in school, that soldiers in uniform should not be permitted to address students and that the Board of Education has no right to put military training into the schools. He is further accused of having written and placed on sale in the school store a bibliography referring to works unfit for children to read.

The third is charged with deeming it proper to maintain an attitude of neutrality in class discussions on (1) the "relative merits of anarchism as compared with the present government of the United States" and (2) the duty of every one to support the government in all measures taken by it to insure the proper conduct of the war.

These charges are set for trial December 3. They will be heard by the Committee on High Schools and Training Schools of the Board of Education and the teachers will be represented by counsel. Doubtless some of the charges suggest unificess for reaching; whether any of them imply actual disloyalty is not so clear. The teachers themselves protest that they are "100 per cent loyal" and that their conduct is merely the outgrowth of a belief in perfect freedom of discussion. The charges assume secondary importance, however, in the light of the educational policy that is responsible for bringing them.

The charges grew out of a series of questions asked De Witt Clinton High School teachers by John L. Tildsley, associate superintendent of schools. Only the principal, Mr. Tildsley and the teacher examined were present, except for part of one man's examination, when a strongrapher was also present.

Naturally reports vary of what took place. In going over with the writer afterwards some of the questions that he had been alleged to ask, Mr. Tildsley not only admitted having asked certain questions but gave the answers that he himself regarded as bound to be given by anyone whose views on education were sound. Thus, it was clear that he believed "yes" to be the only proper answer to this question: "Would it not be wise to cultivate in our schools some of the virtues 250

cultivated in German schools, viz., love for and spirit of obedience to one's parents, love for the fatherland and a willingness to make sacrifices for it, a spirit of obedience to law," etc. Some of the other questions that Mr. Tildsley admitted

that he asked were these:

Should not children leave the high school with the idea that whatever institutions have survived the test of time are more probably right than those that have not?

What would you do if a boy called President Wilson a murderer?

Does the critical attitude in children need encouragement?

What would you do in order to curb the individualistic tendencies of our boys-Russian Jews?

Do you believe that the Liberty Bond question is still open for discussion?

These are the mildest among the questions which the teachers say that Mr. Tildsley asked. But it is not necessary to rely on his questions to learn Mr. Tildsley's views on educational policy. The following sentences were taken by the writer substantially at his dictation:

I believe that public school teachers are state servants. They have obligations to the state higher than those of ordinary citizens. They must discharge these obligations actively, not passively. Teachers are in a position analogous to that of the army and the police force; it is their business to support organized institutions, not to oppose them.

A lot of these teachers at De Witt Clinton High School believe that by giving absolute freedom of discussion to children you enable them to reach proper conclusions. I differ with them absolutely on that point.

These were generalizations, so Mr. Tildsley became specific: When the government has once authorized the issuance of Liberry Bonds, the windom of that course is no longer open to question. It may be discussed until Congress has acted, nor after. If the question of a second issue comes up, it is again open to discussion unit settled. Issues are temporarily closed to discussion while governments policies are being carried out.

Mr. Tildsley's views have further practical implications than this, however. An interview in the New York Tribune, which he admitted accurately expressed his opinions, quoted him as saying:

In the De Witt Clinton, Supyvesant and Boys' High Schools, where he pupils are largely foreign born or of foreign-born parents, it cannot be denied that Socialistic views are in the ascendency. This tends to create antagonism to the government. The attitude of some of the candlers is to blame, because, being themselves pacifiest, interesting the contraction of the candlers are described by the contraction of the candlers are described by the contraction of the candlers are described by the contraction of the candle candle

We intend this week, if possible, thoroughly to stamp out this evil. Every teacher who does not come up to the proper standard of patriotism will be severely dealt with.

This makes of socialism not a political philosophy or even a party program, but a species of criminal disposition. Mr. Tildsley is apparently unaware that many Socialists have come out strongly for the part played by this government in the war.

A New York daily has remarked that Mr. Tildsley's place is in Berlin, but it is not necessary to go so far afield. His methods are the methods of autocratic industrialism made familiar by Colorado, West Virginia and Lawrence, Mass.

These are some of the fruits of the concept of education that has been allowed to prevail in this case. Next week the SURVEY will discuss what seems to be the other main aspect of the affair, namely, the rising demand that teachers have more voice in saying what is best for children in the public schools,

WAR FINANCE AND THE COST OF LIVING

ON several occasions attention has been drawn in the SURVEY to the fact, as yet frequently ignored by writers and speakers on the high cost of living, that the rapid rise in prices since 1914 has not, primarily, been due to shortage of food and other raw materials -though this has played its part-but to the inflation of currency which has depressed the purchasing power of the dollar. This fact was brought out by several speakers at a conference on War Finance, held on November 2-3, by the American Academy of Political and Social Science. The subject was more especially dealt with by Carl Snyder, of New York. He said:

The war has already added to the stock of this country a billion of new gold, which has resulted in a credit expansion of nearly 50 per cent and a rise in general prices of nearly 100 per cent. This means that the war will cost us, as it is costing England and other nations, roughly, twice what it would have cost if there had been no such inflation. Here the distribution is not inflation to the state of the distribution of the war will be doubled again.

It is impossible here to reproduce the close argument by which this speaker arrived at his conclusions—which will be found in the proceedings of the conference, to be published in January. The practical question, to him, seemed whether the immense cost of the waraburden of debt which may reach a total of fifty or sixty billions, or more, if the war lasts three years longer—is to be met by genuine saving or by some form of inflation. The problem, as he sees it, is one of expediency. He adds:

It seems to matter little that all this [the rolling up of five billions of loan subscriptions, half of which are merely bank loans] outrageously awollen credit currency, and that the millions of poor people and small investors and life insurance holders who cannot expand their incomes in any adequate millions who arrarely have any voice in mational affairs, and all the more so because they are for the most part un-understanding

and dumb. To them matters of finance and economics are a seven-scaled book; and there seems no one save the most ignorant and demagogic of politicians to give heed to their wrongs.

That the borrowing of money from the banks to buy bonds and the borrowing upon bonds as collateral and the purchase of bonds by the banks is certain to cause inflation, and that this inflation, by causing a rapid rise in prices, must seriously injure nearly all wage-earners, salaried employes and receivers of relatively fixed incomes while benefiting those who pay those wages and incomes-and especially those who have large quantities of commodities to sellwas the burden also of an address by Prof. Roy G. Blakey, of the University of Minnesota. He laid particular stress upon the necessity of economizing now and paying large taxes from current incomes rather than rely upon a policy of future sacrifices to pay for present huge loans:

The government cannot by any financial hocus-pous get twenty billions worth of commodities and services unless we give up that amount and live on the remainder.

It is possible to carry on a huge undertaking like war only by diverting a large part of our energies from the usual channels.

Laboring under the delision that this burden may be shifted in large gun to economize to the extent of two-offshis of our income, which is the average amount that must be saved to carry out present plans.

The necessity for higher taxation was foreshadowed also by Prof. F. W. Taussig, chairman of the Tariff Commission, and by Frank A. Vanderlin, chairman of the War Savings Committee. Alexander D. Noves, financial editor of the New York Evening Post, professed himself an unbeliever in the theory that government loans, except where they have been deliberately used as a basis for currency inflation, have been a cause for the rise in prices. But even he admitted that a very much heavier taxation, decreasing the purchasing power of those upon whom it fell, would unquestionably inhibit the rise in prices.

A NEW PEACE OFFER FROM RUSSIA

"I HEREWITH have the honor to inform you, Mr. Ambassador" thus, in the formal style of diplomacy. Leon Trotzky, Russian national commissioner for foreign affairs, addresses governments that refuse to recognize him or the People's Commissaries for War, of whom he is one, and who claim to speak for the Russian people and government. Ambassador Francis and his colleagues of the allied embassies on November 22 were in the uncomfortable position of having to transmit to their governments a communication from Trotzky which it was impossible for them to acknowledge formally, but which contained news of the greatest importance. In it, Trotzky proposes an armistice on all fronts.

The governments of all the belligerent nations (and these nations apart from their governments also) are invited to consider as a formal offer of an immediate general armistice the declaration in favor of such an armistice and of a democratic peace on the basis of no annexations or indemnities and the self-determination of nations recently approved by the All-Russian Congress of Soldiers' and Workmen's Delegates.

Publication of this message is accompanied by renewed verbal assurances on the part of the commissaries that they are entirely opposed to the idea of a separate peace between Russia and Germany. The fact, however, that an eminent general has been dispatched by Germany to Petrograd, whereas no new offer of peace or armistice has been made by her to the western allies, would seem to indicate that the central powers hope for a separate peace and will go far to bring it about.

To what extent the Russian people, especially the peasants, soldiers and industrial workers (here named in the order of their numerical and political importance) really support the self-elected commissaries it is impossible to say. Those Americans who have recently returned from Russia seem to avere on this

point: that the common people, now that the monarchy has fallen, fail to see what further use the nation can have for a large military establishment and for war. While the commercial and intellectual classes understand the danger of German supremacy, the people-as everywhere and always in history-merely desire to go back to their daily work and life.

#### BAZARING FOR WAR-RELIEF FUNDS

HE scandal over the Army and Navy Bazar in New York has made a practical issue of the proposal, made long ago and often repeated, that all agencies which appeal to the public for funds shall be required to incorporate, to file audited financial statements with some public body, such as the State Board of Charities, and be subject to oversight by that body. Something of the kind seems especially to be needed in New York, for here center most of the national and international funds as well as the city's own great charities. Yet there is no official oversight like that of the Municipal Charities Commission of Los Angeles and other cities, nor of the kind furnished by charities endorsement committees of chambers of commerce or other quasi-public bodies.

A proposal for official oversight would have been pressed for enactment by the last New York legislature had it not been for the Strong inquiry then being made into the work of the state board. with its subsequent report on the laxity of that body's inspection work and general organization; and for the fact that the charities which did not offer audited statements and resisted the idea of inspection were, for the most part, small in scope and inconsequential in the total funds raised.

Now, however, the situation has changed. The State Board of Charities is credited with fresh life and purpose under the secretaryship of Charles H. Johnson, and the importance of the unincorporated charities has increased a thousand-fold with the advent of the war-relief agencies which appeal to every pocket-book and raise funds into the millions.

Most of these agencies, as listed by the Charity Organization Society, are admirably managed, and many of them meet the standards of work and of accounting set up by the best of the older societies. About a few there has been question, usually for a failure to make proper statements. Some have stood out against any form of oversight on the ground that what small staff they hadif any-was working day and night and could not take time from raising money for dire need to tell just where every penny was sent and whence it came.

Then the newspapers printed the

story of the bazar with figures, as yet not officially audited, which showed a net return of about \$700 on the \$70,000 spent by the public; in other words, that it cost about \$100 to get a \$1 kit to a soldier

Whether or not anything comes of the talk of official investigations, indictments by the grand jury and of demanding a return from advertising solicitors and others who worked on a commission basis, the affair offers a shining example of the costly inefficiency of raising money by bazars and entertainments. Every Ladies' Aid Society knows that money would have been lost on the church supper if Mrs. Russell had not given the chicken pie and Mrs. Snook the cakes. So, too, on a larger scale, social agencies have come to look with increasing disfavor on all forms of moneyraising except by straight appeals for gifts made by salaried or volunteer representatives, never by agents working for a commission or a bonus.

The bazar exposé came just before the opening of Hero Land, perhaps the biggest money-raising show ever given. The management immediately announced in large display advertisements that the \$150,000 which its installation had cost had been met in advance by the concessionaires, most of whom are the war-relief agencies, and by gifts. Its announcements declare that

every cent received at Hero Land (whether at the booths, at the exhibits, in entrance fees or from any source) will-after payment of rent, advertising, clerical hire, decorations, insurance and the bare expense of operation—go directly to the great war-relief committees (whether American or foreign) of rent, advertising, clerical hire, decorations, management committee receives no profit, percentage, salary or remuneration.

Hero Land, a circular announcement informs us.

will be the greatest spectacle the world has ever seen, for the greatest need the world has ever known, and will combine the best and most elaborate features of a military pageant, a patriotic entertainment and a spectacular bazar. It will serve three major purposes: (1) to relieve a distress the like of which has never before been known; (2) to offer, on a magnificent scale, instruction and entertainment to the 5,000,000 inhabitants of

> December 1, 1917 Vol. 39, No. 9 THE SURVEY Published weekly by SURVEY ASSOCIATES, INC. 112 East 19 street, New York

New York; (3) to help defeat our enemies abroad as well as confound the disloyalists within our gates.

Along with these unimpeachable sentiments and the portraits of Mrs. Woodrow Wilson, Mr. Balfour and Ian Hav. who are among the patrons, the publicity man has beguiled the management into a request to "help along the Hero Land idea of a soup kitchen for poor soldiers and civilians," which just misses staring in the face of another page, "Pleasures of eating at Hero Land, where-Mr. Hoover, please note-"the public will find every kind of cooking and every kind of food for every kind of taste," including "good musty ale." On another page the delectable tea room of the Red Cross is coupled with a para-graph concerning the Golden West Cabaret-"a place where a committee of great ladies are to serve light teas and suppers and only such alcoholic stimulants as great ladies would condescend to serve."

There is a breath of reminiscence in such a mixed program for those who can remember back to the era of street fairs in the Middle West. Street fairs were given by all of the fiercely competing small cities to "boost" the town and because all of the others did it. They were under the auspices of the very best people and were managed by smart young men who combined resourcefulness with an appreciation of the various and sundry kinds of people who make up a city and the various and sundry kinds of entertainment that must be provided them

Hence it was that the leading merchant found his dignified advertisement in the official program facing one which disclosed to the thirsty that Dutch Arnold's café would be open until midnight every night of the fair, that Dutch himself would be behind the bar to greet his many friends from other cities and that every third drink would be on the

#### CONSERVE FOOD BY MAKING SPEECHES

OR nearly half a year, between two Fand three thousand men and women who volunteered their services as speakers for the Food Administration have waited for precise instructions concerning the subject matter of their addresses. On November 2, Arthur E. Bestor, director of the Speaking Division of the administration, sent out the first two speakers' bulletins containing references to material previously published which speakers are urged to emphasize and outlines of complete lectures which may be built up with the help of this material.

The first of these lectures is based on the idea of food conservation as "an adventure in democracy;" i. e., "by selfcontrol, not by decree; by cooperation, not by compulsion." Another bulletin on the compulsion of the control o

Although obligatory legislation and methods of compulsion play a much greater part in the food conservation among our allies, voluntary effort and education by the spoken word with them also is relied upon to no small extent. In Paris, an organization called "Cheaper Living" has been formed. It is a "national school of economy and thrift," and its lecture courses are followed by formal examinations. From those who pass, delegates are chosen and accredited by the ministers of the interior and of education to hold lectures in the city and suburbs. These "extension lecturers," it is reported, by their personal contact with different groups, already have made their influence widely felt.

# HOSPITALS FOR AMERICAN SOLDIERS

THE war service committee of the American Hospital Association on November 21 formulated a statement of its belief that instead of building altogether new hospitals, as seemed to be the intention of the War Department in preparing for the return of wounded men, existing resources should be utilized as far as possible. Duplication of hospital plants and organization appeared to the committee deplorable at this time when the nation is necessarily husbanding its resources.

Dr. S. S. Goldwater, of Mt. Sinai Hospital, New York, chairman of the committee, cited the example of the British in this matter:

In a statement made to the British Hopinia Association on October 19, 1917, Mr. Horne, representing the Pensions Ministry, and that he ministry had no intention of a state of the property of

The war service committee is of national scope and is instructed by the American Hospital Association to "finform itself of all military conditions in which hospitals may be concerned, to consult with military authorities and to assist in every way whenever desired to do so." The committee has suggested the creation of an "auxiliary medical corps for home service" as a means of cooperation between military and civilian hosvitals.

# Somewhere in America

Laying submarine cable, hundreds of miles of it, to acores of isolated lighthouses is one of the telephone tasks made necessary by the war. The Bell System has also built lines connecting some two hundred coast guard stations.

It has built complete telephone systems for fifteen National Guard cantonments and fifteen National Guard camps, each a city in size, and also at many naval, officer's reserve, mobilization and embarkation camps and at army and navy stations.

It has provided an enormous increase in long distance facilities throughout the country, that satisfactory service may be maintained between cantonments, training camps, guard outposts, military supply stations, war industries, the National Capital and other centers of Government activity. The Government facilities at the National Capital have already been increased three-fold and there has been a tremendous increase in local and toll facilities.

Fifteen thousand miles of telephone wire have been taken from other uses for the exclusive service of the Government and some 20,000 miles of telegraph facilities also provided.

Meanwhile the Bell System has given generously of its man power, until over seven thousand men are in service or recruited for military duty.

Members of the Bell System whether they have already gone to France or whether they have stayed at their posts to help mobilize the country for victory, are equally in the service of the Nation.

SOCIAL DIAGNOSIS

By Mary E. Richmond. Russell Sage Foundation. 511 pp. Price \$2; by mail of the Survey \$2.10.

This is an admirable book, which deserves to be read and pon-dered far outside of the circle for which it was immediately intended. The author's purpose, as she tells us, was to develop a common basis of knowledge for all social workers which could he taken for

granted in the case of any individual practitioner, just as in the case of physician or lawyer or engineer there is a hody of traditionally formulated and transmitted experience which each takes for granted in dealing with his professional brethren. She found this basis in the elements of social diagnosis, and her book is a study of method in the gathering, appraisal and application of social evidence which will not suffer by comparison with the best that has been done along similar lines in the older sciences.

Others who are better qualified than I must speak of the details in their immediate relation to social work. To me the impressive thing is the general attitude of the book toward matters of wider import than its imtoward matters of wider import than its im-mediate purpose and its relation to the movement for a better organization of the social sciences. In the nineteenth century, reaction from the boundless faith in the in-tellect born of the Renaissance led to an era of watertight-compartment sciences, each self-sufficient, content to rest on its own basis and find within itself materials for a critique of itself.

Occasionally those who had mastered one of these compartments would look out therefrom and pronounce dogmatic opinions as to the others, and these exhibitions easily confirmed the occupants of each of the others in their assurance of self-sufficiency. It is common knowledge, to speak but of my own compartment, how seriously jurisprudence was hampered by this attitude in the last generation, though none who were not in the compartment may readily appreciate how thoroughly it was bolstered up by the con-fident dogmatism of critics in other compartments assuming to generalize solely on the basis of the no broader content with which they were familiar.

A stage of unification set in at the opening of the present century. Men began to hreak down the compartments and to let in light and air from the outside. They began to work out critiques of each not from within but from without. Instead of looking out upon others dogmatically from their they began to look at their own from the standpoint of the others and in their relation to the others. But too often this tendency in practice has not gone heyond en-thusiastic promise. Miss Richmond has given us a notable performance in subjecting her own compartment to this sort of critical scrutiny.

Much of the friction between law and

extra-legal social agencies that has been so irritating in the past has been due to ig-

norance and consequent suspicion by each of the problems, difficulties and purposes of the other. The law is an elaborate machinery of balances and compromises between conflicting interests. Those who see only a part of the machinery do not perceive how easily the whole is put out of balance by disturbance of an apparently insignificant cog. Those who have custody of the whole do not always perceive how easily a time-worn part might be replaced with heneficial effect on the running of the whole.

The rise of new interests, especially the relatively sudden appreciation of the social interest in the moral and social life of the individual, put a severe strain upon the machine at the end of the last century, and for a time neither the nature nor the cause of the strain was well understood. Lawvers saw too exclusively the old ends and the old interests, which are still highly important. Sociologists, theoretical and practical, saw too exclusively the new interests. The remedy lay in leading each to perceive the other's aims and the other's problems. I know of nothing so useful for this purpose as the present book. Written as a critique for social work, it is the very sort of book to convince judge and lawyer that the social worker can give him something he can tie to and to dispel the not wholly unfounded suspicions hy which he has been troubled in

the past.

Method for method's sake is futile. the social sciences in the shaking up involved in a stage of unification have suffered from the man who says, "Go to will work out a method," and proceeds to evolve an elaborate scheme a priori to be filled in as he learns the subject-or by someone else as the latter learns it. But ing to reveal a method is only less futile.

The latter does in time develop a certain instinct. Yet it is a most fallible instinct in difficult situations, as the student of AngloAmerican law, with its traditional contempt for general theories, good or had, may testify abundantly.

In all departments of mental activity we need exactly that critical thinking upon experience in order to lay out lines for the future, that organization of experience in one line with reference to experience in other lines and in order to enable us to use it intelligently, which gives true method. Critical gathering of evidence, rational appraisement of it, and straight thinking on the hasis of it when gathered and appraised are prime requirements in every branch of human activity. Men cannot do these things offhand activity. Men cannot do these tunings of that of the social workers are fortunate in having no traditional organon to clear away. Certainly they are fortunate in having for their first essay in that direction the thoroughly scientific piece of work which Miss Richmond

has given us.

Though historians and lawyers had long been wrestling with the difficulties involved in critical gathering and rational appraise-ment of evidence and had developed a cer-tain instinct with respect to them, psychologists have shown us that these things involve much more than we had supposed and are hy no means isolated problems of particular subjects. Anyone who studies them scientifically with respect to any hranch of activity, relating them as they appear in that branch to the forms they assume in neighboring hranches, does a real service to the advance of learning. Thus Miss Richmond's book has an importance much beyond its immediate field.

ROSCOE POUND.

FRANKLIN SPENCER SPALDING-MAN AND RISHOP By John Howard Melish. The Macmillan

Company. 297 pp. Price \$2,25: by mail of the SURVEY \$2.40.

If Bishop Spalding could have taken time from his life-long work for others to think of himself as the subject of a hiography, he could not have chosen a hiographer more after his own heart than John Howard Melish. But all the references to himself that could be

his mother and sister asking why he could not do better work for others. A selfless soul stands out in the open, working with rugged manliness at white heat for others as simply and really as the story of his life is told.

As a man among men, this Christian minister learned to know, preach and apply the social gospel from the conditions of life about him as he met them at first hand in a parish of the well-to-do, in the mining camps and Mormon communities of his missionary bishopric in Utah and in his contact with all classes of people in great cities at home and abroad.

Thrilling is the story of his lifelong struggle for reality in religion and for the realization of the social spirit and ideals of Christianity incarnated in industrial de-mocracy. And much to the credit of the

CHANGE THE STATE OF THE STATE O

An Introduction to Social Psychology

church was, not only its tolerance of his radicalism which went far beyond the views of the great majority of its clergy and laivy, but also its choice of a man of such advanced is it that such a story of his own and the church's social evolution has been told so frankly and specifically, because it is typical of the beroic struggle of many another of the theory is supplied for the project of the project of

churches, and because it is as true of the way in which almost all of the churches have been led at least to recognize their own social function.

But Bishop Spalding really tested the loyalty of the Episcopal church to freedom of thought and liberty of action as few of the compact of the property of the compact of the cours of their price to the cours of their price of the cours of their price of the cours of the cou

vate judgment.

A heroic figure indeed is Franklin Spencer
Spalding as Dr. Melish portrays him, "standing there a sermon in reality," and the portrayal of him as both bishop and Socialist
attests withal the free spirit of his church.

Grahiam Taylor.

AFTER-WAR PROBLEMS

Edited by William Habbutt Dawson. 366 pp. The Macmillan Company. Price \$2.50; by mail of the SURVEY \$2.65.

the SUNUY \$2.65.

The contributors to this volume are the late Earl of Cromer, Viscount Haldane, Professors Alfred Marshall and S. J. Chapman, two bishops, a labor member, a progressive tory member and two liberal members of Parliament, the leading English housing reformer, the Earl of Meath, Mrs.

Fawcett, Margaret McMillan, a majority member of the late poor law commission, a well-known medical officer, a large employer, and several more—a distinguished if somewhat motley company. The threads running through all their contributions and binding them into a whole are a sincere desire for social reform and willingness to give up the old dividing lines of party, creed and class.

In some ways, the volume marks a new departure in social and economic thought: here men and women of pronounced convictions try to see the naked ruth and to accept its lessons for the future without rewards of the converse of the future without rewards to the converse of mining royalies admits that the burden of taxation can only be lightened by applied Socialism: "There is only one direction in which we can successionly one direction in which we can successionly one direction in which we can successionly to the commonity. To begin with, we should naturally turn to monopolies." A labor leader admits that the restitution of former trade-union that the restitution of former trade-union impulse of patriotism, without regard to changed circumstances is not the most in-

telligent aim for the labor movement to adopt; but that "for us, a general increase of output becomes a matter of extreme

The book is divided into four sections, dealing with Empire and Citizenship, Na-tional Efficiency, Social Reform and National Finance and Taxation. All of them are full of suggestions, most of them directed towards immediate practical ends. Perhaps that is immediate practical ends. Perhaps that is regrettable; for it gives to the program as a whole—if unrelated proposals made by persons with such widely varying viewpoints may be regarded as such—too conservative a tone. National progress may be sustained for a time by various elements in the nation uniting upon the eradication of old and obvious evils—such as bad housing conditions or the subsistence of large classes conditions or the subsistence of large classes below a decent minimum standard of life-and upon safeguards against immediate dangers—such as a swamping of the labor market after demobilization, the burden of debt, or inefficient methods of industrial dueation; but a more sweeping flight of the imagination is required, a more prophetic vision of the future, if the magnificent mutual loyalty of the people shown during the

ing human betterment.

Though Professor Chapman and G. H.
Roberts, M. P., come near it in their thoughts ful contributions, none of the writers sug-gests that the whole wage system upon which modern England is built up is fundamentally wrong; that labor—at least the temperawrong; that labor—at least the tempera-mentally progressive and supiring element in the labor world—never will be content with grievance boards or industrial parliaments, however well worked out in detail, but will, ever more loudly clamor for a real partici-tory of the progression of the participation of the ever more loudly clamor for a real partici-tive more loudly clamor for a real participation. Aldridge knows and feels it, he does not in this evaluous pack of the resemial unwholethis volume speak of the essential unwhole-someness of all large cities and of the right of the average man to a better home than the bare minimum of accommodation considered by medical experts essential to health.

Margaret McMillan, for so many years ridiculed as a dreamer, until she proved by her work that vision and practical achievement go together, alone "unveils new horizons." For she closes her paper thus: "We zons." For she closes her paper shus: "We have spent much time in gathering statistics, in comparing methods,' and also in a great variety of petitiogging reforms. The time for such work is over. Through the dimness that is our past and the cloud of storm and blood that lies just behind us, glances something that is more precious than anything, we hope for multiple something that the state of dazzling, undreamed-of joy that echoes through the footfalls of colossal failure and ",worros

BRUNG LASSES

THE DISINTEGRATION OF ISLAM
By Samuel M. Zwemer. Fleming H. Revell
Company. 231 pp. Price \$1.25; by mail
of the SURVEY \$1.37.

The author of this very interesting work is a missionary who does not conceal his hostility to the faith with which he deals. He tells us nothing of the days when Moslem culture led the world and all Christian Europe was in utter darkness—save in the rehappenings among Mohammedans he gives a good if rather disconnected account-para good if rather disconnected accountempar-ticularly of the Wahabi movement. One of the most valuable things in the book is the estimated population of the Moslem world on pages 113-114. The estimate of only eight millions for the Chinese empire (or republie) is surely too small. When the present reviewer lived in that country twenty years ago there were mosques in every city, over twenty in Peking and four

in Tientsin, while the Moslem population of China proper was estimated at some thirty millions. There are many more in Chinese millions. central Asia.

Books about Mohammedanism are so often written in a spirit of shallow sneering at Christianity that it is a most welcome relief to find one from so different a standpoint. This careful work is almost indispensable for the serious student of missionary work among the followers of Islam today. Here in a word is an eloquent sermon on the text: "The answer to the claims of Islam is the condition of all Islamic lands." Still, it is impossible to read it without imagining a similar work on the present condition of the civilization that Christianity inspired. No enthusiasm for missions must ever blind the zealous Christian to the fact that by far the most important thing to be done just now is to bind up the wounds of Christendom.

IAN C. HANNAH

KING COAL

By Upton Sinelair. The Macmillan Company. 396 pp. Price \$1.50; by mail of the SURVEY \$1.62.

A dozen or more years ago, Upton Sin-clair's The Jungle, succeeded in shocking the people of the whole country. The government investigation of stock-yards and packing-houses that followed led to an-other tale of horrors, couched in govern-mental English, and then Congress passed

meat-inspection bill. King Coal, the latest book by the same author, is not likely to have a similar effect. For one thing, people do not eat coal and they are less sensitive about conditions under which it is produced. Moreover, govern-mental investigations, magazine articles and press dispatches have in the last few years centered public attention on coal minea to an unusual degree. Discussion and agitation in this case have preceded instead of being aroused by the book. To a remarkable de-gree Sinclair has succeeded in catching and

visualizing the spirit of a certain phase of industrial life.

The story is of a wealthy young man who, wanting to study sociology at first hand, sought a job in a coal mine. He happened on a section closed to the unions, and his first experience in applying for a job in-volved a beating-up and a night's lodging in jail because he was suspected of being a union organizer. When he finally succeeded in getting on to a mine payroll, his education progressed rapidly. Because he could tices as short weights, political dominance of the company and denial of free speech, he found himself the leader of a strike and then the principal actor in a farce or a tragedy, the principal actor in a raise or a range or a coording to the point of view, known in Colorado as "going down the canyon." In other words, he was run out of camp.

The strike fails and the story ends with

the hero clad once more in his city clothes, speeding on a train back to the life which he

had temporarily ahandoned.

Insofar as the story is intended to be an account of actual conditions, it must be accepted as a description of an extreme rather than of the average. But the story is neither impossible nor improbable. It might be hard to find any one mining community which contains all of the brutality and viciousness credited in this story to "North Valley" and the coal company officials therein who com-bined in themselves all the functions of government-legislative, judicial and executive. But it is not too much to say that the

story as a whole faithfully and accurately describes a régime which has existed in coal mining communities and which has not vet passed away, although it is passing. Many of the incidents that seem extreme and im-probable can be verified from the records of

official governmental investigations.

The book is more than an exposure of certain outrageous industrial practices. It is an admirable study of human character and motives. For the most part the characters are genuine types and anyone who has visited the coal-mining country where industrial war has been most hitter will recognize them at a glance.

Yardsticks. for the Invisible SE

To make Alfred Binet's psychology available to those who do not read French is a distinct service to the cause of the education and care of the sub-normal. This has been normal. This has been excellently done by Miss Kite as translator and the Training School at Vineland as publisher. Binet's method of psychologic-

al measurement is so well known and its value so generally recognized that the present translation of his complete work on the subject will add little to his fame. But hy the earnest student who desires to understand how the method was evolved these two volumes will be highly prized.

The translation has been made with rare skill and accuracy. It could have been done so well only by one who is in complete sympathy with the authors and who knows the feebleminded and is an experienced expert in mental testing. Everyone who uses the Binet-Simon tests will do so with increased confidence as they read these books and understand the vast labor involved and the seientific care and devotion which made them possible.

Inevitably at present, and perhaps for many years to come, mental measuring of children will be mostly done by practical teachers rather than by highly trained paychologists. This may be deplored, but must be accepted if the measuring is to be done on a large scale. The contributions by Drs. (Continued on page 260.)

NS OF FRANCE By Eugenie M. Fryer.

Many charming drawings by Roy L. Hilton as well as fine photo-engravings.

The first complete account ever written of the hill-towns of France. A series of word pictures of some of the castles and other points of interest in French towns. These sketches have charm and individuality and succeed in giving the old fortresses real character and picturesqueness.

THE BOOK OF THE WEST INDIES By A. Hyatt Verrill.

The author for twenty-five years spent much time exploring, traveling and now and then living in those regions and is everywhere recognized as an authority on their history and present conditions. The volume is profusely and beautifully illustrated and tells all manner of things about the islands, seas, people, story, present day life, resources, senic beauties and interests.

AT ALL BOOKSELLERS G. P. Putnam's Sons NEW YORK, 2 West 45th Street LONDON, 24 Bedford St., St

(Continued from page 258.)

Mead and McCall, which are published by Teachers College, are thoughtful efforts at the interpretation of the results of some unique experiments by the authors and their assistants with some sound philosophical dissertations on mental measurement in generaand on the theories of statistics. "The results of all good experimental work will live, but as yet most of them are like hieroglyphics awaiting their deciphering Rosetta Stone," are the words of Spearman.

Dr. Mead's contribution is particularly valuable, because it consists of a contrast between two groups of children, one an abnormal group of inmates of the Indiana School of Feebleminded, of which the author was principal for several years, the other an approximately equal group of normal public school children in New Jersey. The tests were designed to include the order of development of the child as to talking, walking, etc. One present difficulty in the way of measuring abnormality is the lack of sufficient, scientific data as to normality, and Dr. Mead tries to supply this lack to some extent. To bring up mental measurement to its full usefulness, many such faithful and intelligent studies are needed, and Teachers College has given two valuable contributions

to the developing science of child psychology.

A frequent criticism of the Binet-Simon tests is that they involve the use of language and to some extent reveal the results of instruction rather than native ability. need of testing the mental capacity of deafmute children led to the methods described in A Scale of Performance Tests. It is evident that the Binet scale is not available for such children. The tests devised and used by Pintner and Paterson may be given with-out using any words, either spoken or written, and so are applicable not only to the deaf but also to immigrants and others with no knowledge of the English tongue. A few of the tests, like some of those devised by Healy and others, partake of the nature of a puzzle and hence are tests, not of general intelligence, but of the peculiar ingenuity that works by intuition or a fortunate chance, rather than by reasoned judgment. How-ever, the book will be of help in certain cases that are embarrassing to the tester and will, no doubt, lead to further development of the kinds of tests described. The volume includes some useful criticisms of the Binet scale, the Yerkes point scale and others, and forms a valuable addition to the armory of

the practising psychologist. Dr. Melville has given us a very useful and practical work on the Binet test, especially and chiefly valuable to the teacher or superintendent of schools, who is not himself and cannot command the services of a trained psychologist, but who feels the imneed of mental testing in his work with children.

ALEXANDER TOHNSON.

THE RISE OF DAVID LEVINSKY

By Abraham Cahan. Harper & Brothers. SURVEY \$1.72.

The Rise of David Levinsky follows the life history of its subject from a poverty-stricken childhood in the Jewish quarter of a little Russian town to a lonely old age in a gilded hotel in New York city as a milonaire cloak manufacturer. Told in the first person, it reveals with crude and unashamed realism the growing ascendancy of the sensual over the spiritual, the material over the ideal, in the narrator's own life; and the little worlds in which he successive ly moves, reflect back the same tendencies from a thousand angles. The people we are introduced to are in varying combinations crude, selfish, sensual, tasteless—above all tasteless!—foolish, ignorant, ambitious and egotistical.

# BOOKS

Social Significance

# The Polish Peasant in Europe and America:

Monographs of an Immigrant Group

By WILLIAM I. THOMAS ind Florian Znaniecki The University of Chicago

A series of several volumes, the first two of which are announced for publi-

cation in January, 1918. Vols. I and II. Primary Group Organization.

The main purpose of the work is to show the dependence of the individual on society, and the dependence of society upon the individual; and eventually to determine in a scientific manner what are the laws of this dependence, and how the relation can be controlled in such a way as to make an ideally efficient so-

ciety. A new method is developed which, it is believed, will enable the social sciences to calculate problems with increased ac-

сигасу. The materials incorporated and their systematization will prove of interest to students of history, psychology, economics, education, political science, etc. The information and the sociological laws will be of immediate practical ap-plicability in social ques-tions like immigration, crime and war.

Further information regard-ing the series, or indiviously volumes of the series, will be furnished on request

Send for Holiday Bulletin and circulars of Children's Books

Houghton Mifflin Co. New York  (Continued from page 260.)

Had the book been published anonymously, we might have taken it for a cruel cari cature of a hated race by some anti-Semite. But the author is Abraham Cahan and the caricature is all the more cruel for the thousand little touches of realism which could have been given only from the inside. We get a clew to the purpose of this unflattering portrait in the fact that the only civilized people in the book are the somewhat shadowy figures of the He-brew poet and his Socialist offspring. The thought occurs that this, then, is not so much an address to the general public as a much an address to the general punic as a call to non-Socialist, non-union sinners in the household to repent, and to withstand the tempiations of the world, the flesh and the devil. Which is all very well, but un-fortunately this campaign poster will be taken by an already critical outer world as a picture of Jewish life in general. It really is not. There are some admirable traits in the character of even the business Jew, and we would advise, after a reading of this book, a recourse to our lovable, amiable and human friends, Abraham Potash and Morris Perlmutter. KATE HOLLADAY CLAGHORN.

THE PASSING OF A GREAT RACE
By Madison Grant. Charles Scribner's
Sons. 245 pp. Price \$2; by mail of the
SURVEY \$2.15.

Rash is the man who passes lightly from skull measurements to vast unprovable sociological and historical generaliza-tions. The pseudo-science of Gobineau and Houston-Cham-berlain and the ethical theory which makes it the function of the strong man to purge the world of the weak,

might, one hoped, by this time have gone out of date. The ungentle render may begin to doubt the mass of information offered as to the prehistoric men whose condition must be inferred from very scanty data when he notes the method by which the truth as to historical and contemporary facts is arrived at

As illustrations of method take the fol-

lowing: "These influences are so deeply rooted in everyday consciousness that the average novelist or playwright would not fail to make his hero a tall, blond, honest and somewhat stupid youth, or his villain a small, dark and exceptionally intelligent individual of warped moral character" (page 199). of the greatest difficulties in classifying man is his perverse disposition to mismate. This is a matter of daily observation, especially among the women of the better classes" (page 19). "The small colonial population of America was, man for man, far superior of America was, man for man, far superior to the average of the present inhabitants" (page 44). "In the French revolution the majority, calling itself "the people," deliberately endeavored to destroy the higher type; and something of the same sort was in a measure, done after the American revolution by the expulsion of the loyalists" (pages 5, 6). "When slavery was abolished and the white man had to plough his own fields or work in the factory, deterioration began" (page 38). "What progress humancan make under the control of universal suffrage, or the rule of the average, may find a further analogy in the habits of certain snakes which wiggle sideways and disregard the head with its brain and eyes. Such serpents are not noted, however, for their

ability to make rapid progress" (page 7). ability to make rapin progress (page 1).

The these of the book are roughly: the superiority of the Nordic strain (and the consequent presumption that what is superior,

(Continued from page 262.)

in the writer's estimation, is Nordic), the disadvantage of racial intermixture, the "unfitness" of the unsuccessful, and the pro-priety of eliminating the "unfit" by steriliza-tion. This process "can be applied to an ever-widening circle of social diseards, beginning always with the criminal, the di-seased and the insane, and extending grad-ually to types which may be called weaklings ually to types which may be called weakings rather than defectives, and perhaps ultimately to worthless race types." "This is a practical, merciful and inevitable solution of the whole problem" (pages 46 and 47).

The problems of racial intermingling, of

intra-racial selection, of the eugenic effect of social policies regarding defectives, of the morals of the treatment of the weak by the strong, and not least the practical task of securing that the social system does not through injustice or stupidity bring about those failures which the privileged then construe as "unfitness"-these are all of first rate interest and importance. They are not to be solved by obiter dicta like those of Mr. Grant, but only by the unprejudiced investigations of true science and the patient experiment and observation of worker in

EMILY GREENE BALCH.

RELIGION FOR TODAY

By John Haynes Holmes. Dodd, Mead & Co. 335 pp. Price \$1.50; by mail of the SURVEY \$1.62.

Religion and Life

pretation of religion in the terms and to the needs of today gathers vigor and timeliness from the occasions which called forth these thirteen public addresses. Their spo-ken style stirs in the reader the earnestness with which they were delivered and the interest with which they

The author's inter-

must have been heard. Although meant for today, they do not ignore the yesterdays of their topic. A retrospective background balances and maintains the perspective of each of the vital themes in their application to

present situations.

Trenchantly, yet constructively critical in his attitude throughout, Dr. Holmes strives to give enough of the other side which he criticizes to present it fairly if not fully. Therefore, while describing the religion for today as "new" in being scientific rather than traditional, ethical more than theological, social as well as individual, unifying more than divisive, yet he emphasizes these characteristics as contemporary expressions of the old and only religious spirit.

Especially incisive and conclusive are his social applications of religion to the conditions of life and labor which demand both its destructive and reconstructive power. Church and world, legislation and morals, human brotherhood and the fratricidal caste and class spirit, are thus brought to the vital tests which demonstrate the responsibility of faith for practice, of ideals and standards for actual conditions. The selection and treatment of these points of contact and contrast demonstrate the author's social intelligence and thoroughly modern point of view.

Especially thoroughgoing is the way in which he meets the challenge of the oft-rewhich are meets the channels of the ort-re-peated and always evasive assertion that people cannot be made good by legislation. He presses the claim that justice should supersede charity a bit too far, however, in contrasting public justice with private chartity, strangely failing to refer to those public forms of relief and humanitarian service which the injured, the sick, the defective and many of the aged, are always likely to need,

whether furnished charitably or in recognition of their just claims.

Although recognizing the opportunism which has brought about such broader social views and applications of religion, Dr. Holmes is an absolutist in his uncompromising stand for the ultimate ideal of peace as applicable to a world at war, but he fails to show how it could have been, or could be, applied by the peoples facing s war-rampsat astion on a rapid march for world conquest. Sustaining the reader's in-terest in every line, compelling assent or dissent with no chance for neutrality, Dr. Holmes has contributed a vital discuss fundamental human interests which drives the resder to identify religion with them.

THE BATTLE WITH TUBERCULOSIS AND HOW TO WIN IT

By D. MacDougall King. J. B. Lippin-cott Company. 258 pp. Price \$1.50; hy mail of the SURVEY \$1.62.

In these days of war and military preparation Dr. King has chosen a timely subject aration Dr. King has chosen a timely subject for a new, popular book on tuberculosis. The title is The Battle with Tuberculosis and How to Win It, and throughout its two hun-dred and more pages the book deals with tuberculosis as an enemy against which the human body carries on constant warfare. Trench, block-house, machine-gun, rifle and various other implements of warfare are various other implements or warrare are brought into action. Various officers of the army, including the chief medical officers, appear with prominence. The military fig-ure and symbolism incline to exaggeration at times, but it is telling, nevertheless, and adds much to the interest and stimulus of the book.

With the increasing number of books of a popular nature for tuberculosis patients and their families, Dr. King's book will have a certain amount of competition. His new a certain amount of competition. His new and refreshing point of view, however, will help to stimulate flagging interest on the part of many tuberculosis patients and workers. There is also a wealth of prac-tical information which Dr. King has summed up in these pages that anyone in-terested in tuberculosis would do well to have at his command.

PHILIP P. JACOBS.

THE NATIONAL BUDGET SYSTEM AND AMERI-CAN FINANCE

By Charles Wallace Collins. The Macmillan Company. 151 pp. by mail of the SURVEY \$1.33.

As a plain exposition of what the budget system means in practice in other countries and of what the present American system, or lack of system, as practised by Congress in matters of financial legislation, means, in matters of manucial regulation, means, this compact little book admirably fulfils the purpose of its author. Public finance is neither interesting nor easily understood and the man of affairs is scarcely better informed on this subject than the average member of a legislature.

Much stress is properly laid upon the history and hudget practice of Great Britain and while all that the author says in praise of the English budget system is true, he has missed the significance of the treasury as 8 grest independent department of administraon or business management which makes it at one and the same time the great foundation and the crown of the British system. He has likewise failed to call attention in his references to authorities and sources for further study of budget systems to the returther study of budget systems to the re-markable collection of literature on this sub-ject edited and published by the New York Burcau of Municipal Research, especially that which has appeared in its publication entitled Municipal Research. Indeed the author seems to have availed himself little

# WHEN THE HUN CAME DOWN

-when field-gray uniforms poured into little Belgium, the Secretary of our Legation was witness to the tragedy.

What Hugh Gibson saw and felt in the days when he was often under fire, always in peril, he has put into a book of lasting importance. Because it is so true, so intensely human, it stands out in unmistakable manner from the mass of "warbooks.

You do not soon forget-

"The Rape of Belgium" A IOURNAL FROM OUR LEGATION IN BELGIUM

By HUGH GIBSON, \$2.50

With all the old-time fire, Kipling tells new and stgnificant stories about men and women and affairs. Here is Stalkey again and the delicacy of "They," and altogether different war-stories.

### A DIVERSITY OF CREA-TURES

By RUDYARD KIPLING \$1.50. Limp leather, \$1.75

This is the truth about what men called, "Jim Hill's luck"; made plain and simple as he wanted it to be made. A crosssection of an America grow-ing into greatness, is this not-able biography.

THE LIFE OF JAMES J. HILL

By JOSEPH GILPIN PYLE Illustrated, 2 vols., boxed, \$5.00

To speak with authority on affairs of moment, and at the same time speak interestingly, is the unusual qualification of the editor of "Life." His col-lected war editorials are an aid to atraight thinking.

THE DIARY OF A NA-TION

By E. S. MARTIN. \$1.50

DOUBLEDAY, PAGE & COMPANY

Garden City, New York.

if at all of this material and does not make a single reference to the writings of Fred-erick A. Cleveland, the American publicist and chairman of the Taft Commission on Economy and Efficiency, to whom more than to any other American we are indebted for earnest advocacy and consistent exposition of the principles of hudgetary procedure in

municipalities, state and nation.

Notwithstanding these defects this hudget primer ought to serve a very useful purpose and is a worthy addition to the growing literature on the subject of the hudget. SAMUEL MCCUNE LINDSAY.

APPLIED PSYCHOLOGY

By H. L. Hollingworth and A. T. Poffen-berger. D. Appleton & Co. 337 pp. Price \$2.25; by mail of the SURVEY \$2.37.

This new book is the best that has yet appeared in bringing the results of many appeared in aringing the results of many experiments and excursions in this field within two covers. The reader finds state-ments of the latest formulations concerning such subjects as the relation of efficiency to physical and mental characteristics of the sexes, chronological and mental age, social and legal age limitations, temperature and humidity, illumination, daily schedule, interruption and concentration, work, rest, fatigue, sleep, tohacco, alcohol, tea, coffee, drugs, scientific management, advertising, salesmanship, evidence, punishment, delin-quency and deficiency, psychotherapy, edueation.

In the chapter on medicine a distinction is drawn between the use of psychological agents which require a "profound knowledge of the refinements of modern psychology" and those which call rather for a "sympathetic acquaintance with and toleration for human nature." This is a point of view which is easily lost as one wanders into the various fields, but a great advance has been made when it is seen that the same material mauer when it is seen that the same material has value for both types of workers. The last four chapters on Psychology and the Law, the Social Worker, Medicine and Edu-cation, show well the other aspect a man needs to have in mind in order that he may be efficient in the one which gives him major occupation.

In connection with this showing of psy chology in its relations to improvement i practically all of our interests, activities and occupations, the authors have given, in their introductory chapters, about the best state-ment available of what one needs to know about general mental operations. Hitching the psychological wagon to the steeds, suc-cess and control, has helped greatly to reduce the amount of useless haggage carried. Either the student in a class or the business man or employe who wishes to get a clear idea of what is worth while about instincts, inheritance, habit and skill formation, memory, etc., will find here the introduction he requires.

FRANK A. MANNY.

THE MODEAN HOSPITAL

By John A. Hornsby, M. D. The Modern Hospital Company. 109 pp. Price \$1; by mail of the SURVEY \$1.09.

The gist of Dr. Hornsby's argument is in In e gist of Dr. normsoy's argument is in his opening paragraph. Here he says that fewer than 12 per cent of the sick people in this country are using the hospitals. And since bed-side diagnosis and drug treatment are practically obsolete; since modern diagnosis depends upon various laboratories, and modern treatment upon diet, physical therapy and special nursing, it follows, therefore, that 88 per cent of our sick are not

getting the best care possible.

It is to the community which believes
that the modern hospital is the logical cen-

. - - New York

35 West 32d Street. .

ter of treatment in its wards, of advice in its out-patient department, of such preventive measures as elinic examinations suggest, Dr. Hornsby has addressed his little volume. He shows the community how to decide what sort of hospital it needs, how to raise the money for it, how to control and administer money for it, how to control and administer it, how many jelly-molds are needed in its pantry and how to deal with refractory "help." An enormous amount of practical detail is packed into these pages, and the audience to whom the book is directed will derive much practical benefit from the unpacking.

Like every other institution of this day, the hospital has entered upon a new era. Un-like certain institutions, it is as yet some what in advance of the community. And the reader whose personal interest is in the more general aspects of health and medical progress rather than the immediate necessity for a hospital in his neighborhood, will find in the new emphasis which this book places upon the institution, matter for reflection, interest-and doubtless action, when the time

RUSSIA IN TRANSFORMATION

By Arthur J. Brown. 190 pp. Fleming H. Revell Company. Price \$1; by mail of the SURVEY \$1.08.

The Peaceful Millions

This book, bringing the story of the Russian revolution up to the end of July, is useful as a coherent account of events which to the average newspaper and magazine reader have remained somewhat vague and unconnected. written without apparent bias and, though it

adds little to the from other sources, may be recommended as a manual of reference on movements and

persons.

One suggestion especially worth noting is that we should not imagine the whole nation in a turmoil of political excitement and economic upset so grave as to render stable economic upset so grave as to render statile government and an ordered life impossible. Naturally, the press only acquaints us with the abnormal happenings; but "while the political and military situation is seriously alarming, there are many millions of Rus-

sian people who are peacefully pursuing their ordinary avocations."

The author is pessimistic concerning the probable fate of the Jews and other subject nationalities in Russia. He believes that promises now made by frequently changing officials may not be kept after the period of reconstruction. "The ill-treatment of Ne-groes, Chinese and Japanese in the alleged most democratic country in the world, the United States of America," is referred to in illustration of race antipathies which good

intentions do not easily overcome. It seems to the reviewer that the author is making too much of Russian pretensions as regards the near East, more particularly when he expresses fear that in spite of the fall of the autocracy with its imperialistic program, even a claim to Palestine may still be pressed. That in the church the revstill be pressed. That in the church the rev-olution has brought to leadership the most progressive and broadminded elements is good news, if true. But if, as is likely, "Or-thodox Russia enanot imagine that Tsargrad (Constantinople) could be anything else but Constantinople) could be anything else but Turkey," it is not so excuses to belong, to of the shurth work in harmons with the deri-of the shurth work in harmons with the deriof the church work in harmony with the prevailing sentiment of the people.

OUTLINES OF CHINESE HISTORY
By Li Ung Bing. The Commercial Press,
Ltd., Shanghai. 644 pp. Price \$3.75; by
mail of the Survey \$4.

GEOGRAPHY OF CHINA

By Horatio B. Hawkins. C Press, Ltd., Shanghai. 86 pp. Commercial Price 62 cents; by mail of the SURVEY 77 cents.

From the Commercial Press in Shanghai come these two well made, well illustrated The American reader will, it must be confessed, enjoy the quaint illustrations and valuable maps perhaps more than the text, since his reading of the text will be frequently interrupted by Chinese names which he looks at but does not dare pronounce even to himself.

Mr. Bing's history has a twofold purpose. In his preface, he says that he addresses those who are studying English rather than those who are studying history. "It is not so much an attempt to teach Chinese history by English as English through the medium of Chinese history." Nevertheless, even a cursory glance through the chapters shows one that the book is distinctly modern in its method. Battles are fought and kings described, but the main emphasis is upon the institutions of the Celestial Empire and their

modification in the light of modern events. The aim of this study of the country's history is to develop statesmanship. The volume has a commendatory introduction by Professor Whiteside of Soochow University.

Similar in aim is the volume by M. Haw-kins of Soochow. His geography is of the handbook variety, essentially a text and reference volume. It lays special emphasis on the resources of China, mineral and otherwise; upon the highways of commerce, railways, canals and rivers within the country, and to steamship and railway connections with other countries.

Its illustrations are of interest and the maps of decided value. The hook is by no means out of place in any American reference library. Like the history, it has the practical aim of acquainting the Chinese student thoroughly with the country whose affairs he may one day be called upon to have in a disjunction. share in administering.

TECHNIQUE OF SOCIAL SURVEYS
By Manuel C. Elmer. The World Company, Lawrence, Kansas. 93 pp. Price \$1; hy mail of the Survey \$1.06.

The shelf of books discussing and outlining methods of community study and social surveying has not yet stretched to five feet, but at the present rate it promises to reach that dimension soon. One of the more re-cent to gain a place is Dr. Elmer's little handbook aimed at improving the technique

of community-study.

The book devotes itself to two main questions: the kind of facts to be gathered in social surveys and the use to be made of them, the greater and more valuable part of the publication being devoted to the for-mer. This includes discussions and questionnaires relating to a rather wide range of topics having to do with social welfare, the more important among them being pop-ulation and vital statistics, educational agencies, recreation and amusement, Indusagencies, recreation and amusement, indus-try and labor conditions, disease and health measures, housing, public utilities, trans-portation and storage, distribution of wealth, political organization, taxes, charities, courts, child-care, defectives, juvenile and adult tionnaires on educational and recreational facilities and on housing are developed in more detail than the others. A few topics, particularly public health, taxation and in-dustrial conditions, are not adequately dealt with for a book on survey technique.

# "Why the Nations Rage"

While the hook has the weakness of many others on the same subject, namely, its dwelling too briefly upon the purpose in and reasons for collecting the mass of facts called for, and of instructing too little in the interpretation and methods of using the facts, it nevertheless has suggestions for the surveyor and will he of use to individuals, clubs and other groups of citizens who wish, perhaps, not so much to make a survey as to become intelligent upon social conditions in their own community. It calls for data that public-spirited citizens should want to possess and that ought to be of value in suggesting steps for the community's advancement.

#### SHELBY M. HARRISON.

AN INTRODUCTION TO SOCIAL PSYCHOLOGY By Charles A. Ellwood. Appleton. 343 pp. Price \$2; by mail of the SURVEY \$2.20.

In the midst of a world convulsion, Professor Ellwood presents us with a theoretical study whose quiet aloofness from immediate problems may prove intellectually refreshing to some minds. Compared with his previous volumes on sociology, this Introducti to Social Psychology has certain new points to offer, taking us a little farther into the analysis of the way in which individual ideas and so-called "natural tendencies" of human nature are effective in hringing about social changes. Now and then there flashes out a thought of immediate bearing upon the dif-

ficult social psychology of war-time. Such a paragraph as the following, for instance, strikes home at a time when the power of government is exerted to an extent previously unthought of in the United States, and when the ideas or action of minorities tend to be submerged: "The burden of responsibility for main-

taining flexibility of social life through the free functioning of the mechanism of conscious social change rests, however, especially upon the ruling classes, that is, upon thou who are in charge of the institutions of social control. If the governing class will keep in touch with the needs of all classes; if those in authority in government, in law, in indus-try, in education and in religion will seek first the public good; if they will seek to keep open the means of understanding and sympathy with all other classes; if they will keep free public criticism and discussion and all the means of forming rational public opinion and of selecting authorities to carry out the same, there will be no danger of revolution being resorted to in any social group" (p. 182).

Professor Ellwood's book, however, will remain rather for the special student of psychology and sociology than for the general reader. The student will find a balanced presentation of various factors of importance in social life, and a thoughtful analysis of the psychological factors underlying the stahility, as well as the changes of human society. It is unfortunate that sociological works seem to run toward the use of words of many syllables.

# his Is the Master's Work

The keystone of civilization is the New Testament. Its ideals and principles are the ideals and principles toward which the race is struggling. Its ideals and principles are those FOR WHICH WE FIGHT THIS WAR.

A noted writer has said."I believe this war has been

brought about by neglected lesus Christ." Certainly

the great fester of Prussian cruelty would never have been suffered in a world in sympathy with the teach-

ings of Jesus.

The men in the trenches are coming to realize this "Everywhere," said William Allen White, lately returned from France, there is evidence of a growing interest in religion.

Two million of our boys , and men are already under arms. Thousands more may be called. They come, for the most part, from the highways and byways, are without church affiliations, and have never intimately known Jesus Christ, Now,

face to face with danger and privation, with new temptations, and new hardships, they are looking for light.

If this be true, then equally important with the rifle and the first aid kit, in the equipment of the tighting man, is a Testament,

President Wilson says, in heartily endorsing this effort: "I hope this object may be accomplished for the sake of the men who are going to the front. THEY WILL NEED THE HELP OF THE ONLY BOOK FROM WHICH THEY CAN GET IT."

The American Bible Society is supplying free of.

charge the requests for Testaments of the Army and Navy chaplains. In addition to this the society has granted without charge one million Testaments to the Y. M. C. A., which their secretaries will distribute. This will secure a Testament to each man wishing one. None will now be overlooked.

The American Bible Society has done this in the name of the Christian People of America, The Society is only the agency through which it is done. The Christian people of America are giving the Testaments. \$400,000 is immediately needed for this work.

This is the great opportunity of the century for get-

ting the Gospel of Jesus Christ seriously read and profoundly understood. The American Bible Society is taxing its credit and its capacity to produce these Testaments. We are trying to do our plain duty. Will you help? \$25 will onthit a company of a hundred men, \$500 will outfit a regiment of 2,000 men.

HE NEEDS ALL

LNNN, Mass, after seven years' experience, gave up the commission form of government in the recent election, when a majority of almost two to one voted for a new chatter, to go into effect in January and providing for a mayor and eleven aldermen, four a large and seven by wards. Another Massachusett city, Gloucester, adopted the prefetors may register first, second and third choices for all candidates. Waltham cittens, dissatisfied with their present mayor and addermen system of government, voted in favor of the city manager plan and abolition highest votes becoming members of the conticil and selecting the manager from among their own number. Two other Massachusetts towns voted on changes in government with negative results: Winchester turned down the town manager plan, and Haverhill and four shock committeement.

# First Aid to New Voters

The Experience of Illinois Made Available for New York Women

By S. Grace Nicholes

EXECUTIVE SECRETARY CENTRAL MUNICIPAL CITIZENSHIP COMMITTEE OF THE WOMAN'S CITY CLUB OF CHICAGO

HEN the legislature of Illinois in June, 1913, granted partial suffrage to the women of the state, the question immediately arose-How are the women going to use in a wise and workmanlike fashion this complicated tool to which their hands are wholly unaccustomed? Many people felt the need of a rallying point for information, a center from which would radiate educational activities in behalf of this large class of new voters. It was natural that the citizens of Chicago should turn to the Woman's City Club, an organization which had been working for civic betterment, and ask-How are we going to apply this new remedy, the ballot, to the evils which we have been striving to reform? The Central Municipal Citizenship Committee was therefore formed, with Jane Addams as chairman; It was financed largely by the Chicago Equal Suffrage Association.

The committee was organized to assist the new voters to make an intelligent use of the ballot. An office was opened in connection with the Woman's City Club and later an executive secretary placed in charge.

These were the tasks which confronted the committee: to arouse the interest of the new voters in the government, to disseminate information, to utilize the public press, especially the foreign-language papers, to instruct the foreign women, to form classes, to rally the women to register and vote, to form non-partisan ward and precinct organizations, to hold mass meetings, to oppose partisanship in local affairs, to encourage women to act as judges and clerks of election and to furnish information on candidates and measures.

The first group of newly enfranchised women for which the committee felt responsible was composed of those of foreign birth. A class was formed for English-speaking foreign women and a simple course in American government offered. To this came not only the alien women, but workers among them from the Bureau of Charities, the courts and the Immigrants Protective League. Eleven different nationalities were represented, an unusually bright and alert group of women-editors of foreign newspapers, physicians and court interpreters, most of them leaders of their own groups.

This was a normal class and the endeavor was made to impress upon its members that they were in training to teach good citizenship to the women of their respective nationalities. A political boss, addressing a large meeting of foreign citizens, was much surprised to be interrupted by a woman who said in broken English: "We know that is not right that you are telling us. We have been taught by the Woman's City Club. You should go there, too, and learn!"

But the foreign women were not the only ignorant voters. In response to a demand from women of all stations, classes in citizenship were formed, some in the daytime to meet the housewife's need, others in the evening for the working woman, one at noon for the down-town business woman and one or two on the boulevards for the society woman.

The noon classes were the most popular. At one time there were as many as 300 in attendance, business girls who were willing to use their noon hour for civic instruction, more eager to learn to be good citizens than to eat. One large dry goods store gave an extra half hour at noon to its women employes to attend these classes in citizenship.

The young women, too, were interested. Some of them, not yet of voting age, attended the classes to take home the information to older members of the family.

A course was prepared for the teachers of the public schools and talks were given in one hundred and five different school houses. In women's clubs, ward and precinct organizations, lodges, ladies' aid societies, afternoon teas, political meetings, churches—in short, wherever women congregated—there was a demand for instruction in citizenship. To these various organizations the citizenship committee furnished speakers, at times sending over three a day. Many of the settlements formed classes or delegated some person to instruct informally any new voters who might apply. At one time classes in citizenship were held at the Woman's City Club every day in the worst.

While this class work was being conducted, a campaign of education by publications was also carried forward. A Handbook for the Women Voters of Illinois was issued by the Chicago School of Civics and Philanthropy. This was a simple, comprehensive statement of the structure of the government and was invaluable in familiarizing new voters with the complicated form of government in which they were called upon to take part.

A Catechism for Women Voters was published, giving in the simple form of questions and answers instruction in regard

Dialerd by 275 ogle

to the offices for which women might vote and the qualifications necessary to become a voter. Over 100,000 of these werdistributed and 25,000 were translated into Italian, Polish, Lithuanian, German, Bohemian and Yiddish. The simplicity of its form and wording made it easy for even the unlearned and timid new citizen to comerehend.

Under the election laws of Chicago all citizens have to register before they may vote. Thousands of leaflets were distributed through women's clubs, through ward organizations, in the churches and in house to house canvasses, urging upon women the necessity of registering in order to vote. Thirty thousand of these were translated into six foreign languages.

The first voting which the women of Chicago faced was a primary election for aldermen for the City Council. The primary law was complicated and difficult to understand. "To vote or not to vote at the primaries" was the question of the hour in many women's organizations. The Municipal Citizenship Committee called attention to the importance of aiding in the selection of candidates and advised that in those wards where there was a contest it was the new voters' duty to cast their ballots at the primaries for the best men. This the women did in a truly intelligent fashion and in the eleven wards in which there were contests voted in large numbers, in two being the determining factor in nominating the good government candidates and in the remaining strengthening the better element.

Before every election some publication has been issued discussing the questions which have been submitted to the voters. There have been bond issues, technical amendments to the municipal court act and questions of public policy which the women have had opportunity to help decide. At one time Mary E. McDowell, chairman of the City 4Vaste Committee of the Woman's City Culb, warned the council committee that because the administration gave the citizens no assurance that a bureau of city waste would be established with a technical engineer in charge to spend the funds, the women would be advised to vote "no" on the proposed \$2,000,000 bond issue for garbage disposal. Publications were issued advising a negative vote and the women succeeded in defeating the bond sue at the November election. The following spring the city had compiled with the women's requirements by establishing the Bureau of City Waste and saked for a million dollar bond issue. This the citizenship committee urged the women to support and it was carried.

Following the first elections, analyses of how the women voted were published. Of particular significance were two articles by Edith Abbott which appeared in the National Municipal Review, reprints of which were secured and widely distributed.

It was possible for Miss Abbott to demonstrate by actual figures the result of the women's vote, since in Illinois their ballots are counted separately. She showed that the woman's vote alone would have nominated the better candidate for mayor at the Republican primaries in 1915 and that a larger percentage of women than of men voted for the less undesirable Democratic candidate. In two wards women were the determining factor in electing the conspicuously superior candidates for aldermen, and in twenty-four out of the thirty-five wards the percentage of women voting for the better candidates was higher than the percentage of men. In the following election the women saved the day for the good government candidate in one ward at the primaries, and at the election voted for the better candidate in seventeen wards in larger percentage than did the men.

In issuing publications it has generally been the policy of the committee to discuss only the propositions submitted to the voters and the general principles upon which their decision should be made. The Municipal Voters' League, a well-established organization, issued reliable information and recommendations in regard to aldermanic candidates and the Woman's City Club was one of their distributing agencies. The first time they were called upon to assist they placed 100,000 of these reports. In two instances, however, the Municipal Citizenship Committee published the records of out-

HEALTH COMMITTEE OF THE CHICAGO CITY COUNCIL DISCUSSING THE MILK SITUATION WITH A COMMITTEE OF THE WOMAN'S CITY CLUB

LECTURES ON CIVIC TOPICS FOR FACTORY AND OFFICE EMPLOYES DURING THE LUNCH HOUR

going candidates, one to show how the aldermen had voted on certain measures in which the women were particularly interested and the other to give the records of candidates for trustees of the Sanitary District, a field which was covered by no other organization. The newspapers have given generous space to all the publications issued, and many of the foreign language newspapers have reprinted entire articles.

In addition to meetings of various sizes throughout the city, three large mass meetings were held in cooperation with many women's civic organizations.

A registration mass meeting held on February 2, 1914, overflowed from the Auditorium into some half dozen smaller meetings, one or two of which were held on the street corners. The newspapers devoted many columns to this meeting and there was no reason why every woman in the city of Chicago should not have known that she must register in order to vote. Results were good; the names of 151,137 women were added to the polling lists.

After the primary election, ward rallies were held in a number of down-town theaters, at which the candidates from all parties were invited to address the women voters. At these gatherings arrangements were made for kindergarteners to amuse the children while their mothers listened to the speakers.

At every election since women received the ballot a large number of them have acted as judges and clerks of election. To show an appreciation of their work the Citizenship Committee invited them to a luncheon at which they were addressed by prominent women officers. Two hundred and twenty-five judges and clerks attended.

The city meanwhile had fallen into the hands of an administration which was a disgrace to its citizens. The women felt this keenly, particularly since they had endeavored in their first voting for mayor to nominate the reform candidate. It was the men's majority that had given Chicago its present unsatisfactory head.

In March of the year 1916, therefore, the women arose in their might and called a mass, meeting of women voters to point out abuses in the government and especially to protest against the spoils system which had fastened its grip upon Chicago. From all localities the women gathered to express their indignation over the shame of their city.

They adopted a Woman's Municipal Platform, embodying the principles of good government for which they stood.

The preamble stated:

When in the administration of the city government, officials elected for the purpose of safeguarding the interests of the chiir commiting give evidence that they are violating the trust imposed in them, select their subordinates for the purpose of strengthening a political party, and attempt to destroy the independence of a coordinate department of government, it is appropriate that those women who value the known the principles which govern their civic activities and should unit to secure the widest acceptance of those principles.

Therefore, we, women citizens of Chicago, in mass-meeting assembled, pledge ourselves to secure the sober consideration of the following municipal platform and effective action towards its realization.

Among the principles formulated were planks on civil service, health, shools, housing, public recreation, crime and police. A pledge of citizenship was given "to the promotion of the welfare of all the citizens and to the securing of equality of opportunity for 'all the children of all the people." "This is probably the first time that a gathering representing no particular political party has ever adopted a constructive platform for steady work embodying definite principles of good government for which it means to strive.

# Chicago Woman's Municipal Platform

#### PREAMBLE

WHEN, in the administration of the city government, officials elected for the purpose W HEN, in the administration of the city government, officials elected for the purpose of sateguarding the interests of the entire community, give evidence that they are strengthening a political party, and attempt to destroy the independence of a coordinate department of government, it is appropriate that those women who value the welfare of the city above personal or party advantages should make known the principles which govern their civic activities and should unlet to secure the widest acceptance of those principles. Therefore we, women citizens of Chicago, in mass-meeting assembled, plege ourselves

to secure the sober consideration of the following municipal platform and effective action towards its realization:

We demand the enforcement in good faith of the Civil Service Law and the extension of the principles of civil service to the selection of all officials to which those prin-ciples are applicable. We condemn the present abuse of the sixty-day appointment clause of the Law, and the manipulation of examinations and other tests which break down all safeguards for public officials in order to legal-ize the appointments of the Mayor. We urge upon the Civil Service Commission the necessity of high standards of employment, including one day rest in seven for all employes.

#### DEPARTMENT OF PUBLIC WELFARE

We regard the Spoils System as responsible for the failure of the Department of Public Welfare to render the important community service for which it was created. We recommend its entire reorganization on a merit basis.

#### TELEPHONE FRANCHISE

We deplore the action of the City Council in refusing to submit the question of the sale of the Automatic Telephone to a vote of the citizens of Chicago.

#### HEALTH

Believing that it is the first duty of Chicago to protect the health of its citizens,

We urge the administration to carry out as rapidly as possible the recommendations of the City Waste Commission, that the city acquire the necessary equipment for the collection of its garbage and waste; that it construct, own and operate the necessary reduction and incineration plants; and that competent business management eliminate

all politics from this problem.

2. School Hygiene: We endorse and commend all measures looking towards the more effective protection of the health of school children, and urge the selection of the highest type of medical officers for the School Inspection

3. Bake Shops and Kitchens: We endorse and commend the activities of the Sanitary Bureau in its efforts to do away with basement bake shops and kitchens. SCHOOLS

#### We demand:

 That the schools be divorced from politics.
 That members of the Board of Education be selected solely with reference to their capacity and public spirit.

3. That the Mayor refrain from interfering in the selection of school officials.

4. That the Board of Education define the functions and 4. That the Board of Education define the functions and duties of the various school officials, select them with reference to their ability and training, and leave the administration of the schools to the officials thus selected.
5. That teachers be allowed to exercise all the rights

of citizens, including freedom of organization and political

6. That greater attention be devoted to the subject of adult education. That the schools be organized for wider community

In order that the ordinances which have been enacted from time to time with reference to the construction and use of teaments the contraction and use of teaments the contraction of the contraction and the contraction of th

We therefore use upon all women the necessity rate where the stands we commend that the competence of the comment of the c

#### PLEDGE OF CITIZENSHIP

We pledge our citizenship to the promotion of the welfare of all the citizens and to the securing of equality of opportunity for "all the children of all the people."

During all this time the office of the Municipal Citizenship Committee had maintained a bureau of instruction in regard to women's rights in voting, measures to be decided and candidates to be elected. At one election when there were twentyone different offices to be filled, a card catalog was kept of the candidates and information furnished to all who applied. The effort was made to make this information, both in the interviews and in publications, educational and not personal, by pointing out the principles of good government and why this particular candidate's record or characteristics would make him unfit or desirable for the office.

It is difficult for the ordinary citizen to obtain knowledge about a large number of candidates and many women stay away from the polls altogether for fear of casting an ignorant vote. If, however, there is a source of information easily accessible they will avail themselves of it and vote. For the most part they put their confidence in other women and particularly women's civic organizations more readily than they trust men's political parties. This has been shown by their slowness in making party affiliations and in the readiness with which they split their tickets. In a few instances their zeal for splitting tickets was carried so far that they even wished to split for presidential electors.

To arouse the interest of young foreign women a club was organized at Hull-House, composed of women clothing workers. Not one of these girls was naturalized, but they entered into the club with great enthusiasm and before many

meetings were held every member had taken out her first

The factory girls have not been neglected. Someone is sent to talk to them at the noon hour, and oftentimes with her audience seated around the lunch tables, amid the rattle of the coffee cups, the speaker explains to them their duties and privileges as citizens.

Before the women of Illinois were enfranchised the Woman's City Club endeavored to turn its members toward the City Hall. Reluctantly and timidly they attended council committee meetings. Since receiving the vote they go with assurance, realizing that the aldermen are their representatives. There is hardly an important council committee meeting at which some women are not in attendance. They address the aldermen with confidence, because they know the facts on which they base their statements. Nor is it infrequent for the aldermen to consult them on the questions under consideration.

The record of this educational work which has been carried on by the Woman's City Club is on the whole encouraging. It shows that the new voters are eager for civic instruction and desirous of making intelligent use of the franchise. The women of Illinois have proved, that given the information. they will vote with independence and discrimination and that in the main they respond to the appeal to cast their ballots not in the interest of any political party or candidate but for the "ennobling of that larger home of all-the city."

# Giving the Teachers a Voice

By Winthrop D. Lane

AST week the SURVEY disclosed the educational ideas underlying the effort to discipline nine teachers in De Witt Clinton High School, New York city. The charge against these teachers, either stated or implied, was an insufficiently robust lovalty to the United States. Three of them were suspended, six transferred.1 The educational policy responsible for their punishment was found in the views of John L. Tildsley, associate superintendent, who believes that "teachers are state servants, like soldiers and policemen, and have a similar obligation to uphold existing institutions, not to oppose them;" that "freedom of discussion is not the way to lead children to form proper conclusions:" that governmental policies are not open to discussion in the class-room after Congress has decided upon them, and that Socialism is an evil which it is the duty of the public schools to help to eradicate.

There remains to be considered the question: How far is the De Witt Clinton affair a symptom of the growing demand by teachers for a higher professional status for their calling, and for a more direct participation in educational and administrative policies?

for the most part little or nothing to say in regard to some of the most important matters relating to the education of children. Their influence stops with the class-room, except insofar as they overreach their authority. Even in places where they do enjoy a wider influence, the initiative usually comes from the teachers themselves and they are not encouraged to express

Throughout the public schools of this country teachers have

their opinions either by their superiors in the school system or by any constituted machinery for finding out what they think,

Consider-these facts for a moment. One high school teacher in New York city is the president of the board of directors of an influential private school. Another is a member of the same board. A third is president of a woman's club. A fourth is on the board of one of the best known social settlements in the country. A fifth conducts the book review department in a daily newspaper. A sixth edits a magazine. A seventh holds office in a taxpayers' association. An eighth is field secretary of a board for welfare work. A ninth is on the staff of a Young Men's Hebrew Association. A tenth is secretary of his college alumni association. An eleventh gives part of his time to an association for improving conditions among Negroes, and a twelfth is a former member of the Assembly of the state of New York.

These are positions of influence and some of them of responsibility. All of them require the capacity to do something besides train the juvenile mind. Not a few of them demand the ability to carry out large policies, to see the welfare of the whole rather than of its parts only, to maintain a critical attitude of mind in the face of the dicta of others. They afford an opportunity to see the schools from the outside and to become acquainted with other forms of organized activity than teaching. They make of teachers not only better instructors, but better critics of education. They give them a surer insight into the community's needs and therefore into the purposes of the educational process.

Many teachers hold positions of this sort. Their experience and versatility could be made invaluable in the larger issues with which every school administration has to deal. Yet

<sup>&</sup>lt;sup>1</sup>The hearing on the three suspended teachers was held before the Com-nittee on High Schools and Training Schools of the Board of Education December 3. Decision was reserved.

teachers have very little opportunity to use these qualities. The result is not only a waste to the school system, but a discouragement to the teachers themselves from taking any interest in things outside their class-rooms.

What has all this to do with the situation at De Witt Clinton High School? Last summer, the Board of Education adopted a bylaw permitting the lengthening of the school day for high schools from five and one-half hours to seven hour; several schools took advantage of this in the fall and those which did not adopt the seven-hour day lengthened their days somewhat. The desirability of the longer day had been discussed at a meeting of the high school principals before it went into effect, but it had not been put up to the teachers.

#### Objections to a Longer Day

Boru pupils and teachers expressed considerable displeasure over the ruling. The teachers' objections were partly that it was unnecessary, partly that it had been forced upon them without their opinion or consent, and partly that it reduced their salaries because of the longer hours required. One hundred and fifty-eight teachers of De Witt Clinton High School, at a meeting called to consider the question, oxted disapproval of the longer school day; this was practically a unanimous vote of those present. They voted also to send a delegation to the Committee on High Schools and Training Schools of the Board of Education to protest.

At hearings of both the aggrieved pupils and teachers, arguments against the longer day were presented. Nothing came of the protests. The chairman of the committee, John Whalen, treated his callers with scant respect. To the pupils he said: "If you pupils go on strike [the pupils had already held strikes on a small scale], I'll close down every school." To the teachers he said: "I want you to understand that the teachers are not going to run the schools."

It is probable that the longer school day is desirable educationally. At any rate New York is not the only city that has put it into effect recently. Nevertheless, the reception given them was a further sting to the teachers' feelings. They believed that they had not been listened to with courtesy or respect. A few of those who had led in the objection to the longer day—members of the faculty of De Witt Clinton therefore drew up a set of resolutions sharply criticizing Mr. Whalen for what they called his "undemocratic" and "unprofessional" attitude. At another meeting of the teachers of that school the resolutions were passed by 102 of the 105 persons present. Copies were sent to Mr. Whalen and to the newspapers.

This, say the disaffected teachers, is what really precipitated the issue that resulted in charges of disloyalty. A week after the resolutions were passed, Mr. Tildsley began his interrogation of the De Witt Clinton teachers. As explained in the SURVEY Issue week, he came to the shool, called a score or more of teachers into the office of the principal one by one and asked them numerous questions concerning their opinions on the war and our participation in it. In the course of his interviews Mr. Tildsley tried to find out who were responsible for the resolutions condemning Mr. Whalen. Among his questions, also, were such as these:

Do you think a committee of teachers is fit to run the high schools?

Do you think that the Teachers' Council of this school is representative of the best influences in the school?

What right have the teachers to use the name of their high school when they rush into print?

As further evidence that disloyalty was not his sole objective, the teachers point to the identity of those whom Mr. Tildsley examined. Four of the first five were members of

the Teachers' Council of De Witt Clinton High School. This is a small body elected by the teachers, which took the initiative in passing the anti-Whalen resolutions and has been outspoken in other respects; its normal membership is seven but only the four called had been elected at that time. One of the first five, moreover, was the man who had presented the briet against the longer school day at the committee hearing. The remainder of those called had either specifically voted for or advocated the passage of the resolutions, or were known to be among the outspoken and more radical members of the faculty.

Moreover, the entire nine who were suspended or transferred are declared to be either avowed Socialists, or to have displayed a willingness in the past to take an interest in school matters outside the class-room. All of the nine are members of the Teachers' Union, one of the fifteen locals of the American Federation of Teachers, which is affiliated with the American Federation of Labor.

On the basis of these facts the teachers say that the whole affair is an effort to cut be class-room instructor, to check any tendency he may show to criticize those above him or to ever an influence on the school system outside the four walls of his recitation. Whether they are right is a matter of some consequence to them and to the teachers and parents of New York city, but there is another question that should prove more interesting to people elsewhere, and that is whether it is educationally desirable that there should be a strong disinclination on the part of administrative school officials to listen to the voice of the teacher in matters of school policy.

It is true that in New York city there exist numerous professional organizations of teachers that make recommendations from time to time to school officials. Sometimes these recommendations are adopted. The initiative in all such cases comes, however, from the teachers; their opinion and advice is not asked for. There exists also a Teachers' Council (not to be confused with the Teachers' Council of De Witt Clinton High School, a local body), consisting of delegates elected by these professional organizations. This council does not represent teachers as a whole; neither has it any official standing. There is no constituted machinery for eliciting the opinion of teachers, nor do officials make any effort to seek them.

Yet for years progressive educators have been contrending that this should not be so. The United States commissioner of education reported in 1915 that the increasing tendency of teachers to take a larger responsibility professionally was one of the most encouraging phases of recent reducational growth. He said that the progressive superintendent "welcomes this added cooperation, endeavoring to make it directly serviceable to the school system." Teachers had been of great help in some places, he said, in selecting text-books, organizing courses of study, developing new work and arousing public sentiment in flavor of increased taxation for school purposes sentiment in favor of increased taxation for school purposes.

#### Minneapolis's Remarkable Cooperation

MINNEAPOLIS recently gave a notable exhibition of the effort to secure the cooperation of teachers in one of the most important matters with which a school administratration is ever faced. A vacancy occurred last winter in the office of city superintendent. The usual way to fill such a vacancy is for the board of education to consider a number of available candidates and to select the one who seems to it best fitted. Instead, the chairman of the Minneapolis board invited the assistance of every teacher and principal in the city. He wrote to each, asking for his opinion as to who would make the best superintendent of schools for the city. He specifically requested the teachers to give their opinions of their own su-

periors—district superintendents and principals. He told them that they need not limit themselves to people in Minneapolis. Their answers would be regarded as confidential and might also be anonymous. Imagine the effect produced by such a letter upon the mind of the ordinary teacher. He would feel that at last some one was really interested in knowing what he thought about the welfare of children in the schools.

In response to this letter 90 per cent of the teachers of Mineapolis endorsed Bennett B. Jackson, the assistant superintendent, for the position. After due deliberation, Mr. Jackson was chosen by the board. He entered his position with the confidence and support of the great body of teachers under him. Whether he will come up to their expectations it is too early to tell, but he has a harmony and cooperation to build on that will do much to win him success.

This was not Minneapolis's first taste of democracy in education. For years the teachers of that city had been trying to win the approval of the board of education for a teachers' educational council that should afford a medium of recommendation between the teachers and the administration. Their efforts had been unsuccessful. Frank E. Spaulding, upon becoming superintendent three years ago, at once asked the teachers to organize such a body. The teachers drew up the constitution, debated it, made changes and finally voted unanimously to start the council. Its members, twenty-six in number, are elected by all the teachers; existing professional organizations have nothing to do with the matter. The city is divided into five districts and each district elects a representative for the kindergarten and first two grades, another for the third, fourth and fifth grades and a third for the sixth, seventh and eighth grades. The grade principals elect two representatives, the teachers of each high school elect one and the high school principals, as a whole, elect two. There are also two representatives of the teachers of special subjects.

This council may meet with or without the superintendent, It may consider any matter pertinent to the administration of the schools. If its recommendations are not acted upon by the superintendent, it may carry them to the board of education. Any three members may call a meeting and the superintendent himself may call a meeting whenever he wishes to put a matter before the council. It is a purely advisory body. Its strength lies in the common sense with which it lives up to its opportunities, and in the fact that in Minneapolis the battle has been largely won for establishing a friendly and sympathetic relation between the teachers and the higher officials of the school system.

#### The Los Angeles Plan

AT PRESENT a plan is under consideration in Los Angeles for establishing closer cooperation between the teachers in high and intermediate schools and the superintendent's office. This is to be done through an advisory council. The council is to consist tentatively of the superintendent and seven teachers. One of the teachers is to be the president of the High School Teachers' Associations and the other six are to be named by the president subject to confirmation by the executive committee. The council may call its own meetings and may discuss any matter concerning which the superintendent could properly act or concerning which the superintendent could properly act or concerning which the superintendent could properly act or concerning which the superintendent of education. Members of the council may take the initiative in introducing subjects, and there may be criticism of any policies of the superintendent or of the board so long as such criticism is kept within "proper professional bounds."

Henry Suzzallo, formerly professor of the philosophy of education at Teachers' College, Columbia University, New York city, and now president of the University of Washington, in an address before the National Council of Education four years ago, urged the teachers of the country to organize for a more effective participation in shaping educational ideals and in controlling the conditions of their own profession. Bodies of laymen, he said, usually have more direct influence upon educational legislation than groups of professional teachers. He pleaded for an organization of the 500,000 public school teachers in America upon a permanent basis that would "insure a day-to-day influence upon school affairs."

#### New York's "Bureaucratic" Regime

New York city cannot claim that this matter has not been sufficiently called to its attention. Not only has an active group of teachers been agitating the matter for years, but the Hanus inquiry in 1911-12 carried recommendations toward that end. Prof. Edward C. Elliott, then director of the School of Education at the University of Wisconsin and now chancellor of the University of Montana, found that the present Board of Superintendents, consisting of the city superintendent and the eight associate superintendents, was an in-effective and unwieldy organization and recommended that it be abolished. It affords, he said, too great opportunity for "bureaucratic and personal control." This is the administrative agency that has been the chief stumbling block to the efforts of the teachers to gain a voice in the school system.

In place of this board Professor Elliott recommended the creation of a supervisory council. This council should be composed, he said, of the city superintendent, the district (not associate) superintendents, a selected number of directors and principals of training schools, high schools and elementary schools, and representatives from the teaching staffs in the various types and grades of schools. The council should be given, he said, general powers and directions with regard to programs of study and all other essential matters relating to the methods and standards of instruction. The city cannot hope to secure the most efficient service, he said, until such a representative board is created, "nor will teachers be given a degree of freedom consistent with the effective performance of the duties" imposed upon them. It is not enough that administrative officials should be able to ask for the assistance of teachers when they want it. "A truly progressive educational policy within the school system," said Professor Elliott, "requires that cooperation be legalized."

Whether the present conflict in New York city will further the efforts of teachers to gain a voice in the school system remains to be seen. The teachers' union, which has consistently stood for such cooperation, has grown perceptibly since the trouble started. Unionism has not yet proved popular with teachers in general and in the eighteen months of its existence in New York city only 800 teachers have joined out of the 22,000 in the public schools. Between November 1 and November 16 this year seventy-five joined, and twenty-two of these were from De Witt Clinton High School.

It is no argument against this program to say that many teachers are not fit to wield a larger influence. They will never become fit until they are encouraged to develop an interest in matters outside the class-room. Under the policy existing in most places today they quickly fall into rust and lose the capacity for constructive, independent thinking on matters of school welfare. In every school system there are doubtless some teachers who will always be routiners under the most favorable circumstances. To learn the number who can throw off the limitations of class-room instruction and become real centers of progressive suggestions and advice it will be necessary to give all teachers in the system an opportunity to do this.

# Four Months in France

## An Interpretation of the American Red Cross III. The Work for Soldiers

## By Paul U. Kellogg

EDITOR OF THE SURVEY

Paris, October 15.

N taking up more in detail what work the American Red Cross has begun and what plans it has under way at the end of its first four months in France, the main lines of this staff organization will be followed as they lend themselves to its three great purposes: to render Red Cross service to the American army, the French armies and the French civilians. The first two of these fall within the scope of the Department of Military Affairs.

First of all, the American Red Cross stands ready as a semiofficial voluntary body to put its money, supplies and organization at the call of the American army for Red Cross service, at every point and at any time, wherever and whenever whey can be of use. It organizes, equips and turns over absolutely to the government the hospital units that are employed in France. This is done in the United States and will not be gone into here. Its medical and surgical division in France cats as an auxiliary to the medical department of the United States army, which is charged with responsibility for the sanitary and medical service of the troops in France. So also its United States army division acts as auxiliary to the expeditionary force.

An army medical department, to do justice to its wounded, must be ready to care for them within twelve hours; it must take its care up to the wounded soldier, not wait until the soldier is brought back. This in modern war calls, with variations, for regimental dressing stations as near as they can be brought to the lines; field dressing stations from which the seriously wounded are sent back, either to movable field hospitals or to evacuating hospitals of from 1,000 to 1,500 beds each (where head, chest and abdominal wounds must be operated upon or you lose your men); and base hospitals to which the sick and wounded are removed as rapidly as they can be safely transported. It is with this general system of the United States army medical department that the Red Cross stands ready to cooperate at every point, through installing rest stations and infirmaries on the line of communication, recuperation stations back from the war zone, neighborhood dispensaries in army villages, diet kitchens and homes for nurses, auxiliary plants for the manufacture of anesthetics, ice and splints, a fund for scientific research and bureau of information on field hospital practice, and through great reserves of emergency supplies of everything from a bandage to a mobile hospital,

#### Ambulances Ready to Crank

In JUNE the Red Cross took over the Norton-Harjes Ambulance Service, made up of five sections of twenty cars each, two men to a car and two officers to each section, and between that time and the date on which responsibility for ambulance transport was taken over by the American army it organized, equipped and put in service eight additional sections. Before disbanding, the number of men had been brought to over six hundred, five hung-red and fifty of them at the front and the remainder in the training camp. Many of these have since gone into other branches of service. The command of the service was under Richard Norton and the work in the field, often under trying conditions, was carried on with nerve and esprit decorps.

As factors supplementary to army equipment, the Red Cross, through its United States army division, has undertaken to place on the lines of communication eighteen rest stations, in which to harbor soldiers who are taken sick while being transported from the port to the front, or vice versa, Six are in operation in existing quarters, new barracks for seven are in course of construction, contracts for five others have been let. Each of these rest stations is made up of from two to four barracks, forty to one hundred and sixty feet long. They include infirmaries fully equipped with baths, waterclosets, laundries, disinfectors and kitchens; dispensaries, rest and reading rooms; dormitories with from forty to two hundred beds, equipped with shower baths and disinfectors; and restaurants and canteens capable in some cases of giving refreshment to a thousand men in an hour. The staff in each includes a manager, a nurse and several volunteer workers. The Red Cross is constructing barracks also for such a rest station and infirmary at the principal American aviation camp

Following conferences with the chief medical officers of the army and the heads of base hospitals, an investigation has been made of several hundred hotels as possible locations for recuperation stations, especially summer or winter resorts where thermal baths may be obtained, where there would be a chance for outdoor sports and a thorough change from the war zone in associations and surroundings. The consensus of judgment is that from time to time a great many men in the ranks will get into a condition bordering on sickness, which can be overcome rapidly if they have some place to go where they can rest, bathe and exercise in invigorating surroundings. One such station will be located in central France near the lines, another probably on the Riviera. Each will accommodate large numbers of men.

Forty dispensaries for the treatment of the civil population in the American army zone have been put in operation under the genito-urinary service of the army medical department. A special corps of army physicians has been assigned to the work and the Medical and Surgical Division of the Red Cross supplies the dispensaries, nurses, motors and equipment. Each motor unit, made up of one doctor and two nurses, is responsible for several villages routed much like a rural mail delivery.

In examining the zone, it was found that most of the doctors had been called out of civil practice and had gone into the French army. For example, in one locality where originally there had been one hundred physicians, there are now only cighteen, and they are all from sixty-five to eighty years old. In large areas there are no physicians whatever. Where our troops are encamped or in contact with the villages, these medical units give general medical care to the neighboring

people by district nursing and take the place of the absent family practitioners and they do this on the theory that to belp the health of the people is to make the region a healthier place for American troops, and so is of very real concern to America. The work is done in agreement with the French military and civil authorities and with the sanction of the syndicate of French physicians.

A wide range of mobile plants for serving the physical welfare of the soldier have been investigated by the American army division and plans blocked out for operating experimental units under a ravitallement service. These include:

Portable kitchens to supply hot food to the men in the trenches and to the wounded at the postes de secours and back of the casualty clearing stations.

Portable ice plants to supply hospitals with ice packs for head and abdominal wounds and to refrigerate hospital foods. (France depends for ice entirely on artificial production and that is overtaxed.) Portable laundries (capable of handling 2,000 pounds of wash in a ten-hour day) to serve hospitals located where there are no facilities.

Portable baths or dauches to be attached to coffee stailons on the tines of communication. (The country is well watered, but the streams are small and cold. Two types of baths have been developed—one for fair and one for inclinement weather. Attached to the boiler which heats the water is a disinfering or delousing apparatus for ridding clohing of vermin while the men are bathing.) Dental ambulances to serve districts where dental rooms are

to be found.

Orbithalmological ambulances for treating init

Ophthalmological ambulances for treating injuries to the eye from shell explosions and gas attacks when quick treatment may mean the saving of sight.

Portable sterilizing plants for serving the surgeons at advanced dressing stations.

Portable lighting plants for lighting hospitals and tents and dugouts used as hospitals,

Mobile complementary hospital to assist in caring for the wounded in a big drive. (The type of hospital developed by the medical corps of the French army includes a radiograph plant, mounted on a truck; a setrilizing plant so mounted; a pavilino containing a radiograph and the properties of the prop

Portable barracks, standardized in sections, so that they can be set up for hospitals, rest stations, canteens, etc.

#### Nurses on Call

UNDER the Red Cross Nurses' Bureau, the first of a series of conferences of head nurses of the American base hospitals recently met in Paris. A plan has been worked out with the army by which the Red Cross will keep on call a reserve supply of nurses and will maintain a nurses' home at which those who become worn out or partially sick in the service can recuperate. The general purpose is to make sure that, whatever befalls, the Red Cross will be in position to keep the army supplied with nurses in good physical condition. Incidentally, the Red Cross is standardizing and supplying winter clothing for the nurses composing the units which reached France and England in the spring.

Experiments are being made in the matter of diet kitchens. In innumerable instances, a very sick man ean be saved by some delicacy or some especially prepared diet, and no matter how good the army ration is, there is seldom anything in it that will tempt him to eat. The Red Cross will supply the necessary apparatus and furnish materials from its stores.

Through its American and French army divisions the Red Cross is installing several specialized plants as auxiliaries to existing army equipment—among these a nitrous oxide plant, a splint shop, an artificial limb workshop in addition to the portable ice plants, laundries and other equipment already noted.

As a result of much negotiation, arrangements have been made for opening an independent workshop at the military hospital at San Maurice, where an improved type of artificial leg will be sold to the French government at cost. The ordinary artificial limbs made in France are unnecessarily heavy and are not well fitted for the stump of the leg. Whether this service will be needed by the American army is not yet determined, but the Red Cross will be in position to supply such limbs if the military authorities wish them.

In knowledge of anesthetics, or rather in application of that knowledge, American practice is far in advance of the general range in Europe. No adequate sources of nitrous oxide exist in France. This gas does not diminish the resistance of a patient as do ether and chloroform. Often, life hangs in the balance on this difference. The Red Cross plant will be installed within the next three months. This anesthetic is not on the army list, and in the opinion of experienced surgeons the Red Cross can save many lives by furnishing it.

Considerable research work has been done by the American medical fraternity now working in France and a large number of subjects are at present under independent investigation. The American Red Cross has appropriated \$100,000 to the research service of its Medical and Surgical Division to enougage such investigations and a medical research committee has been appointed to direct a central laboratory in Paris and pass on applications for facilities elsewhere.

Moreover the division will establish a service of medical and surgical information to furnish surgeons with the latest results of field hospital practice and publish a monthly bulletin. Loan libraries and current medical journals will be supplied to base hospitals. It is hoped to go further and act, with proper safeguards, as a medium between the French, English, Italian, Belgian, Canadian, Australian and American services for exchange of medical discoveries which may have military

Its Medical and Surgical Division has undertaken an investigation of the French methods of dealing with neurological and psychiatric problems, especially so-called "shell shock."

The chief surgeon of the American expeditionary force appointed a board of standardization (of which the director of the Medical and Surgical Division of the Red Cross was appointed a member) which has completed a report on standardization of surgical dressings and splints. This is being published by the Red Cross as a pocket manual and will reduce the number of special splints which are being made, greatly simplifying the work of surgeons in the field.

The Red Cross has undertaken to make and store as large a quantity of dessings for the American army as can be turned out. The same policy holds true of general hospital supplies and stores. Much of this Red Cross work is like that of a fire department. Roughly, you can count that out of a million men employed, one-quarter, or 250,000, will need medical or surgical service.

#### Ready for the Worst

To CARRY on the steady stream of supplies which is needed all the time by an army in action is not enough. To be adequately prepared is to be ready for the maximum load, and to be ready within a space of twenty-four or forty-eight hours—even if hospitals stand empty but ready between times and stocks of goods are piled up which may never be used. In everything human, somehody's guesses go wrong, and the outstanding example of this is the plight which the British army would have been in in the near East had the British Red Cross not built up at Malta great reserves for the army medical service to fall back upon. The American Red Cross has been buying beds, blankets, mat-American Red Cross has been buying beds, blankets, mat-

tresses, portable houses, sweaters, clothing of various kinds, food, tobacco and surgical supplies in bulk, and is filling its warehouses in the American army zone with such reserves. It proposes to conduct its purchasing as fast as it is possible for its purchasing department to function without upsetting the local markets and until it has a supply in hand that will answer any conceivable call upon it.

Aside from this long plan of preparedness, these Red Cross stores are of current use, since they are always at hand in case of transportation delays in government supplies and are rich in medicines and apparatus difficult to secure or needed

for exceptional cases.

The following excerpts are from a letter written by the head of an American base hospital in the British army zone. He acknowledges the receipt of linoleum for floors, tar paper and canvas for the leaky walls of moss huts, heavy dressing gowns for use by the physicians in their tent hospitals, and rubber coats, boots and sou'westers for the nurses (the lower part of the encampent was at that writing—July—under water owing to insufficient drainage.) He then went on:

I cannot tell you how cheered I was when I found how well organized the Red Cross already was in Pairs and what a great start you had made. When an American officer could actually walk into the warehouse which you have taken over from the Serveice de Distribution Americanse and find Squibb's and Mallinckrodt's ether, bathches, adhesive plaster, appring, usigned instruments, keronere lamps, camp happens to need, I for the first time began to realize what the Red Cross might be able to do for waifs like correlees over the ter.

Since we are almost the first people to come, there was no reason for us to expect that we should find you so well prepared and equipped at the present stage of our participation in the war. It all goes to show what an enormously important part the Red Cross will undoubtedly come to play, as more people come over and our affairs overseas get men and more complicated. Unquestionably, counters emergencies will arise and sudden calls, such as ours has been, for a contract of the contract of t

It is true that many of these things can in time be secured through regular army sources, but usually by the time they are secured in this way the need for them is over, or the command which requisitioned them has been moved elsewhere, and there is, in consequence, an enormous amount of waster.

I may add that the way things are arranged at the distributing service in a central place, with offices and officers accusally in the warehouse, so that one is permitted to see with his own eyes just what the supplies are and whether they are actually what he needs, is an admirable combination. One often cannot tell by sering a printed line of objects whether they are the exact things he desires and

Certainly the people at home will subscribe with their accustomed liberality to an organization of this kind, and you will do as much toward winning the war as the men who carry the rifles.

#### Not Magic but Cooperation

THE American Red Cross was not in a position, through any white magic of its own, to provide such diverse supplies one month after its commission landed in France. As already indicated, it has had remarkable agencies to build on, whose development had been cumulative since the outbreak of the war in 1914 and whose efficiency and generous distribution of hospital supplies had made American help known to practically every medical agency in France involved in the war. These will continue to be the corner stone of the humanitarian service of the American Red Cross to the French armies.

Soon after the declaration of war by the United States in April, the American Distribution Service cabled the Red Cross, offering to cooperate in every way, and later the work was turned over with all stocks full. It had been founded and entirely supported from the beginning by Mr. and Mrs. Robert W. Bliss. Its buying, distributing, inspecting and ad-

ministering were in the hands of seven American volunteers architects, artists and others who have given and will continue to give their entire time to it—carrying over an enthusiasm and efficiency which is contagious.

#### One Hundred New Hospitals a Month

WHEN the American Distributing Service became the Medical Supplies Service of the Red Cross, there were 3,190 hopitals on its lists, situated all over France, but most numerous in the departments back of the front. A hundred new hopitals are added every month, and at the present time there are 3,617 in 1,356 towns. The work in hospital supplies heretore done by the American Clearing House and the American Fund for French Wounded will be carried forward through this single service.

Under the Red Cross, the funds available have been more than doubled. Heretofore, a hospital was given perhaps half the supplies it asked for, now it is given perhaps three-fourths, the French to supply the remainder. Moreover, the service can give more expensive equipment, such as radiographic installations, sterilizing outfits and the special instruments needed by surgeons at the central hospitals, much more delicate and costly than those called for in the field service. Two-thirds of the appropriation is consumed in routine supplies secured through the Red Cross purchasing section and one-third direct in the purchase of special instruments and the like.

Everything which can be had in France is bought hereeither through commercial channels or from French workrooms employing rifugiti or crippled soldiers. A three-story garage is used as the main packing and distributing center, and the physical work is done not by volunteers but by convalescents who live and sleep at the Paris hospitals and are paid for the work they do here in the day time, so that in this way two good ends are served. During July and August, the service shipped material to 2,225 hospitals in 5,563 packages weighing 124,158 kilos. The organization has tripled in size since the Red Cross took hold of it.

The service is given free transportation by the French railroads. The government supplies its military hospitals with ordinary medical supplies, but many things, such as special drugs and instruments, are not on the military lists. A requisition signed by the head of a hospital known to the service is honored immediately. When an application comes in from a new institution, a visit is paid by an inspector, a report made and a consignment follows. The service has the right to visit the French hospitals, and the work of inspection is to be made more systematic so that every hospital will be visited every six months.

A division of labor was long since reached between the American Distributing Service and the National Surgical Dressings Committee of America, whose Paris section in trun has become the Surgical Dressings Service of the American Red Cross. 1ts management remains the same, in the efficient hands of Mrs. C. K. Austin. The present organization meets the expenses of administration, the Red Cross that of materials.

Since the Red Cross has come into the work, it has been doubled by adding another floor to the distributing center for dressings for the French army at 118 Rue de la Faisanderie, and by opening an entire building in the Rue Pierre Charron for handling dressings for the American army. The commitees of the National Surgical Dressings Committee in the United States will continue to make the French hospital dressings at which they have become expert, while the Red Cross chapters in the United States will be asked to make the new standard dressings for the American army. A case of twenty-five samples of cach of these has been made up at the Paris workrooms and shipped to America, and a duplicate consignment of samples will go by another route. Much of the volunters work at the distributing center for the Front army is done by American women; much of that at the new center for the American army will be done by French women —a piece of international cooperation that gives characteristic spirit to the undertaking, for from the first it sought to bring French people into its work for the French cause.

The National Surgical Dressings Committee was founded at the outset of the war by Mary Hatch Willard of New York and began with a nation-wide appeal for old linen. Later, new linen in quantities which the Paris section found itself unable to handle, was sent in. This suggested the organization of committees of women throughout the United States to make up the material; and these committees now number one thousand. During the first year, the consignments were sent direct to the hospitals, but under this plan certain hospitals did not get what they needed, while others might receive articles useless to them-an eve hospital get oakum pads, for example. A third stage of development resulted-the systematic organization of a distribution service. Each hospital fills out a questionnaire, giving its number of beds, the kinds of wounds it handles, whether it has a sterilizer or not, etc. Monthly it checks off a card listing the twentyfive standard dressings. A complete dossier of previous shipments is kept, and in making up the inventory in the order department, certain key signals are added which make the work of the shipping clerks at once more precise and more flexible. Hospitals without sterilizers, for example, get only sterile goods; and the sterile and non-sterile supplies are handled on separate floors.

In this way every hospital gets what it wants each month and is sure of its supplies one month after another. The Service de Santé of the French ministry of war supplies the military hospitals with certain standard dressings, but never goes outside these; and it often is put to it to meet emergency demands from the hospitals at the front. That the work reaches home to the man in the ranks was illustrated recently when a French soldier in Paris on permission brought eighty francs from one companion who had been wounded, twenty from another, who did not want their names known but wanted to show their appreciation of the American dressings and wanted their hundred francs to go for more.

The Paris bureau was opened during the summer of 1915 in an artist's studio with two workers and fourteen cases of goods. Today there are sixty paid workers and two hundred and fifty volunteers, handling 1,729 hospitals and sending out 40,000 to 50,000 dressings daily. The greater part is made in America and the Paris work-rooms are in a sense simply a field service ready for anything that comes up. If the supply of operating towels from the states runs short, the Paris workrooms make towels. Recently two hundred cases of dressings were sunk in a torpedoed ship. They stand ready to make good the U-hoat toll. The ambulance drivers seemed to have been overlooked in the matter of first-aid kits. They made up emergency packages for them. In one room, Carrel cushions are fashioned; in another, dressings and apparatus for other extraordinary work. The Service de Santé has an unforeseen need to get off large supplies for the front, and turns to the "surgical dressings" for help. They respond, as in the case when a French hospital was bombed and the physicians were left practically without dressings,

It is just in this feature of reserve supplies ready for an emergency of any size, that the Red Cross is practically revolutionizing the work. Formerly, when the Paris bureau was nentirely dependent on current contributions, the question always was: Can we do it? Hospitals sometimes had to wait. There were occasions when the bureau had only two hundred francs in the bank, with always the chance of an emergency breaking. Now the Surgical Dressings Service has assured backing. It can add to its workers when a prescomes, It can draw on material without limit. And more important still, it can do what has never been attempted before—build up reserves commensurate with any possible demand. A minor but intensely practical reform plays directly into this large-scale planning. The new Red Cross rules call for shipments of bandages, gauze and other supplies only in case lots, which will not have to be opened and re-sorted.

#### Hospitals of Every Sort

THE service which the medical and surgical division of the Red Cross Department of Military Affairs renders to the French army includes, of course, not only the furnishing of hospital supplies and surgical dressings, but also many of the activities already set down in describing the work for the growing American army. The medical and surgical information bureau will be at the disposal of the French army surgeons. Diet kitchens will be operated as well as installed in the French military hospitals. One hundred and forty artificial limbs have been given out since the Red Cross assumed the direction of the relief of mutiles service of the American Clearing House, and limbs of American type from the new workshop at San Maurice will be sold to the French government at cost. The output of the nitrous oxide plant and the splint shop of the American army division will, like the hospitals supply service, be shared not only with the military hospitals of the Service de Santé but also with independent French and American hospitals.

Direct treatment of the French sick and wounded is given by five hospitals which have been taken over by the Red Cross, or in the maintenance of which it is cooperating. These include some of the best known institutions in France:

- 1. Dr. Blake's hospital of three hundred beds at 6 Rue Piccini, Paris, one of the best-equipped and best-run surgical hospitals in France.
- 2. The American Red Cross Military Hospital No. 1, originally the American Ambulance Hospital, a Neully, which has "done more than any other so keep the American flag flying in France during the first three years of the ware." This hospital was surned over for the care and direction of the United States army in conjunction with the Red Cross, and will be conducted along the same lines as in in the past, namely, for the French soldier. A motor ambulance service of one hondred men to exacusate the wounded from the trains coming into on its connection with this hospital, and will be turned over to the American army.
- 3. The Ambulance des Alliés al Annel, hitherto conducted by Mrs. Parke, which the Red Cross has increased in size from seventy-five to three hundred beds. This hospital is near the front and affords an unusual chance for American and French personnel to work logether.
- 4. The French hospital at Evreux, under Dr. Fitch, which makes a specialty of treating injuries to bones and joints. This institution is maintained by the French government, the surgical and nursing personnel by the American Red Cross.
- 5. The Autochir Hospital No. 7, a mobile hospital, practically on wheels and ready to move at any time on short notice, attached to a French evacuating hospital of 1,500 beds near the front. The nursing is done by a group of American women under the control of Mrs. Daley, and the Red Cross has furnished a large part of their equipment.
- The Red Cross will open a hospital for the care of its own sick and that of kindred organizations in France. There is at present not sufficient hospital accommodation to care for the rapidly growing personnel of American civilian workers in case of epidemic. The Red Cross has thus far arranged for thirty beds through the generous cooperation of the American Hospital at Neuilly, which existed as a civil institution

before the war and which since has been the instigator of many of the most considerable American medical activities.

How, through its Military Affairs Department the American Red Cross complements the medical work of the American and French armies, has been outlined. The non-medical work of the department has still to be taken up. Reference has already been made to the rest stations, infirmaries, stores, recuperation camps, nurses' homes, movable kitchens and hospitals and special plants which fall administratively in its United States army division. That division is charged also with recreation work and casualty service.

It is the clear purpose of the Red Cross not only to see to it that every medical resource shall be within reach of the young American troops coming to France, but to stand by with friendly service in every other way that offers. In line with this purpose, it offered to open a troop hote in Paris and additional recreation barracks in the camps. After conference, however, and on the desire of the Y. M. C. A., an understanding was reached that that organization should carry on recreation work in the field and in Paris and the Red Cross recreation work in the hospitals and convalescent homes.

#### The Recreation Huts

IN LINE with this understanding, recreation buts are about to be creeted by the Red Cross at nine base hospitals; eventually they will number sixty. Each includes a social hall, reading, writing and game rooms, a nurses' room, kitchen and Red Cross offices; and its equipment includes a piano, cinema machine, billiard tables and basket ball, baseball, football, tennis and handball apparatus. The recreational work in these huts will be carried on by the Y. M. C. A., that in the wards by the Red Cross.

The Red Cross library distribution service has in hand a large number of complete libraries of American and English books and French dictionaries for the service of patients and personnel. Ten such libraries, totalling 4,000 books, have been placed in hospitals.

In general the Red Cross equipment will be put to all manner of robust and sociable uses outside the sick room. Its portable ice plants will be found supplying cold water to the sound of body and its portable laundries douches and hot water for the same. Anyone who has seen the men come out of the trenches, caked with mud and dirt, drawn and tired by their experiences, alive with vermin, will appreciate that washing and food are the two things most needed to restore them to proper condition. Its kitchens, mounted on trucks, will furnish soup and bread in large quantities. Its chaplains' supply service furnished games, books and phonographs when the chaplains first reached their camps and helped bridge over a critical time. Its infirmaries on the line of communication are places of refreshment as well as of rest; and there is prospect that its recuperation camps will be broadened into great out-of-doors resorts which will furnish an alternative to the cities for men on leave.

The casualty service of the Red Cross army division will act as an accessory to that of the United States army and will amplify and humanize the short reports which the army must of necessity give of men killed, wounded or missing. An inquiry searching station will be opened in Paris, which will keep a card-index of every American soldier reported as sick, wounded, killed, taken prisoner or missing. A corps of searchers will be stationed at all military hospitals, repor stations, base camps, convalescent resorts and shell-shock stations and with every regiment. Red Cross representatives are stationed at the ports.

This division will also send food and clothing in packages to American prisoners. It has stationed representatives at Berne, where, because of the long delay incident to transporting food, a stock ample enough for 5,000 prisoners for six months will be carried.

The distinctive work for the French army division has been that of developing a canteen service in three branches.

The first is at the front, where rolling canteens serve hor coffee, hot bouillon, chooside, tea, and lemonade. Ten canteens are in operation and the number will be increased until there is one for each army corps. New men are going out every week. The work is in cooperation with the French Red Cross and a Frenchman and American work together on each conveyer. They operate in the most exposed regions, often have to wear gas masks for long periods and must always have abri into which they can go from severe shelling.

At junction points on the French lines of communication, troops going forward or back on leave often have to spend hours waiting for trains, without any means for rest or food, occasionally sleeping in the open in the rain. Canteens have been opened by the American Red Cross at four junctions through which approximately a total of 18,000 men pass each day. The troops on permission find substantial hot meals at cost, clean sleeping quarters, proper washing facilities, a chance to change their linen and reading, writing and created on the common. They come in from the fighting zone tired, dirty, hungry, infected with trench vermin; they take the trains out refreshed both in body and spirit.

In Paris the Red Cross is supplementing the work of French centers in carrying on cantens, extrairer and dortoirs at the five chief stations and at three stations on the extra-mural belt line. It is running two canteness at points near Paris which were without them and has opened a night canteen at the Gare de l'Est where no provision existed for trainloads of men reaching Paris after six to ten hours on the cars and after the closing of all the Paris eating places. The city of Paris and its suburbs constitute the great center of French canteen work and through this reinforcement by the Red Cross the service to the soldiers has been more than doubled.

These three classes of canteen work—at the front, en route and in Paris—are the first points of contact between the Americans of the Red Cross and the active armies of France. The thousands reached at the start are rapidly mounting up into the tens of thousands and the French army commanders who have visited the canteens have hailed them with the most outspoken entitue arm because of their stirring reaction on the rank and file.

A bureau for investigating and relief follows up letters of appeal from conimanders, priests and groups of soldiers on repor, in canteens or in the trenches, and refers individual cases to cooperating French organizations.

THIS is the third in a series of four articles in which the editor of the Suwaw describes the work of the American Red Cross in France. The first and second were published in the issues for November 24 and December 1; the fourth will appear nest week. Later articles will describe a wide received a wide received with a work of American social service overseas. The most recent letter from Mr. Kellogg was dated Paris, Nowember 15, just as he was leaving for l'enice with Edward T. Devine and Ernst P. Bichnell, who are in temporary charge of Red Cross work among the relugest flesing before the invading armies in Italy. He had just returned from the devastated regions of France and what remains of free Belgium.

#### "FREE TO DO ANY UNPRECE-DENTED THING"

PRESIDENT WILSON broke a silence of eight months in his address to Congress on Tuesday. He asked Congress "to consider again and with a very grave scrutiny our objectives and the measures by which we mean to attain them; for the purpose of discussion here in this place is action, and our action must move straight toward definite ends. Our object is, of course, to win the war; and we shall not slacken or suffer our-selves to be diverted until it is worn. But it is worth while asking and answering the question, when shall we consider the war won?"

The President did not doubt that "as a nation we are united in spirit and in-tention." He heard "the voices of dissent." he saw "men here and there fling themselves in impotent disloyalty against the calm, indomitable power of the nation" and "debate peace." But these, he held, "may safely be left to strut their uneasy hour and be forgotten." Continuing he said:

You catch with me the voice of humanity that are in the air. They grow daily more audible, more articulate, more persuasive, and they come from the hearts of men everywhere. They insist that the war shall not end in vindictive action of any kind, that no nation or people shall be robbed or punished because the irresponsible rulers of a single country have themselves done deep and abominable wrong. It is this thought that has been expressed in the formula, "No and the state of the s

Just because this crude formula expresses the instinctive judgment as to right of plain men everywhere, it has been made diligent use of by the masters of German intrigue to lead the people of Russin astray—and the people of every other country their agents could reach.

that has been done can right be set up as arbiter and peacemaker among the nations.

But when that has heen done—as, God willing, it assuredly will be—we shall at last be free to do any unprecedented thing, and this is the time to avow our purpose to do it.

We shall be free to hase peace on generosity and justice, to the exclusion of all selfish claims to advantage, even on the part of the victors.

The peace we make must remedy that wrong [military and political domination by arms]. It must deliver the once fair lands and happy peoples of Belgium and northern France from the Prussian conquest and the Prussian mence, but it must also deliver the peoples of Austria-Hungary, the peoples of austria-Hungary, the peoples of its Europe and in Avia, from the impudent and allen domination of the Prussian military and commercial autorcays.

We owe it, however, to ourselves to say that we do not wish in any way to impair or to rearrange the Austro-Hungarian empire. . . And our attitude and purpose the property of the property of

Statesmen must by this time have learned that the opinion of the world is everywhen the development of the control of the control involved. No representative of any selfgoverned nation will dare disregard it by attempting any such covenants of selfshase and compromise as were entered into at the Congress of Vienna.

The thought of the plain people here and everywhere throughout the world, the people who enjoy no privilege and have simple and unsophisticated standards of right and wrong, is in the air all governments must henceforth herathe if they would live. It is in the full, disclosing light of that thought that all policies must be conceived and extended the standard of t

The President recommended that the United States declare war against Austria-Hungary, which "is, for the time being, not her own mistress but simply

the vassal of the German government." Turkey and Bulgaria, he said, "are mere tools, and do not yet stand in the way of our direct action." He would have further legislation regarding enemy aliens, women as well as men, confining those who break the laws in penitentiaries, and he would "create a very definite and particular control over the entrance and departure of all persons into and from the United States."

Congress must go further, he believes, "in authorizing the government to set limits to prices," and, while he did not recommend a national budget system for the thirteen billion dollars of appropriations which will be asked for, he urged that all such bills be initiated and prepared in a single committee of the House. Later, he said, legislation may be needed "to effect the most efficient coordination and cooperation of the railway and other transportation systems," and he held it imperative to provide for the development of the water powers and other natural resources still under federal control.

MEANTIME Congress has before with two domestic measures—the constitutional amendments on woman suffrage and prohibition—which press for immediate action because of the great numbers of people interested in them, because they were left unfinished at the close of the special session and because the national conventions of the American Woman Suffrage Association and the Anti-Saloon League, which meet in Washington next week, will focus attention forcibly on them.

Whichever way the vote goes on prohibition—and the drys believe it has a good fighting chance—there will be a concerted effort to secure a war-prohibition measure; for, it is pointed out, the slow process of the constitutional amendment through the state legislatures could not effect a saving of grain for at least two years.

The suffragists have high hopes, particularly with the new body of women citizens of New York nudging the elbows of their forty-three Congressmen.

# MINNESOTA'S MINIMUM WAGE IN JEOPARDY

THE minimum wage law of Minneorable decision by the Supreme Court of the United States in the Oregon case. The Minnestot law differs from that of Oregon in that it deals with wages alone and not with hours or health conditions generally, in not providing for court review and in other particulars. The Minnesota commission has been prevented by an injunction from taking any action since November 14, 1914.

On November 21, 1917, arguments were made before the Minnesota Supreme Court on the law's constitutionality. The case at issue was that of the A. M. Ramer Company, manufacturer of candy, against Eliza P. Evans, et al., constituting the Minimum Wage Commission. The case had been before the Supreme Court before, but decision was withheld. Now, writes Oscar M. Sullivan, statistician of the Minnesota Bureau of Labor, to the Supreme.

it was reargued in the light of recent decisions. The decisions of the United States Supreme Court in the workmen's compensation cases and in the Oregon misimum wage cases, as well as the recent Arkanass minimum wage decision, were cited by the state. The main contention of the assailants of the law was that it is a delegation of legislative was that it is a delegation of legislative "at its discretion," where the law says the commission may investigate wages, and the expression "if it sees fit," where power is given to order new rates of minimum wages.

As his is a point covered only by the Minnesota constitution, a decision against the constitutionality of the law on this ground would be final, putting out of the question any appeal to the federal court. Should the law be held constitutional, there is nothing to prevent the commission from being reconstituted and set in operation again. Both are the properties of the properties of the propriations for its maintenance in order to meet such an emergency.

Another effect of the law being held constitutional would be to render employers affected by the six orders the commission had sissued before it was enjoined, liable in civil action for the difference between the amounts paid and those fixed as the minimum. As the paid and those fixed as the minimum. As the amounts and the properties of the six of the amounts of the six of the six

# THE BISBEE DEPORTATIONS ILLEGAL

THAT the deportation last July of 1,186 men from Bisbee, Ariz. "was wholly illegal and without authority in law, either state or federal." is the conclusion of the President's Mediation Commission, of which Secretary of Labor William B. Wilson is the chairman. In their report given out last week the commission indicates very clearly that the action constituted an interference with the selective draft law, an interference with interstate commerce and a violation of the laws of Arizona. Consequently, they recommend to the

President that the facts be laid before the proper officers of the law in Arizona, and in addition the Interstate Commerce Commission and the attorney-general of the United States.

The report severely condemns the action of those responsible for the deportations. It states that they have been used "to affect adversely public opinion, among some of the people of the allies." and that "their memory still embarrases the establishment of industrial peace throughout the country for the period of the war." at a time when the maintenance of industrial peace is indispensable "if the war is to be brought to the quickest possible successful conclusion, and if lives are not to be needlessly sacrificed."

The facts as recorded in the report to the President, though couched in the coolest and most unimpassioned of language, constitute a scathing arraign-

#### CHILLY DAYS ARE COMING, THE SAD-DEST OF THE YEAR

COLD-BLOODED folk are to be appears. They must patroically shiver in silence while the quicksilver glides inexorably downward from a blistful 80 or 78 to a bitter 68 and even 65. For thus saith the Fuel Administration.

From their stiff end fingers the pen may fall, witt may conged that ersituable tolled bravely or even scintillated now and then, nerves paralyzed lated now and then, nerves paralyzed conting spirit; and the observant efficiency man will make notes on the wrong side of his ledger. But why mown! The response of agents and mown! The response of agents and sings to the administration's relict will ings to the administration's relict will ings to the administration's relict will of hearthy patroicie, no doubt, sind if one's only hope lies in the pneumococcus germ, why then, twelcome, like hope of a better, perchance even a warmer, word.

ment of some of the citizens of Bisbee and the officers of two mining com-The commission took the view that the strike itself was not based upon grievances of such a nature as to justify a cessation of work in view of the government's need for copper production. It points out, however, that there was "no machinery for the adjustment of difficulties between the companies and the men, which provided for the determination of alleged grievances by some authoritative, disinterested tribunal, in which both the companies and the men had confidence, and before which they had an equal opportunity of urging their respective claims." This condition is emphasized by the commission as a "fundamental difficulty.'

After thus expressing their opinion of the basis for the strike, the commission

turned to the events which followed it. It seems that shortly after the strike was called the sheriff of Cochise county tried to have federal troops sent into the district. As a result, a regular army officer made two investigations, on June 30 and again on July 2, "After both investigations the officer reported that everything was peaceable and that troops were neither needed nor warranted under existing conditions." This opinion was corroborated by testimony before the commission on the part of "reputable citizens as well as officials of the city and county." In spite of this fact the deportations occurred ten days laterthe exact facts of which may best be recorded in the language of the commis-

Early on the movining of July 12 the sheriff and a large armed force, presuming to act as deputies under the sheriff's authority, comprising about 2,000 men, rounded up 1,115 men in the Warren district, put them about a train and carried them to Columbard a train and carried them to Columbard and the sheriff of the deportation to leave the men there, and the train earried them back to the desert town of Hermansa, N. M. in nearby scation. The offern of Hermansa, N. M. in the state of the sample of the sheriff of

The deportation was carried out under the sheriff of Cochie county. It was formally decided upon at a meeting of eitizens on the night of July 11, participated in by the managers and other officials of the Cop-Frederick of Copper Queen Division) and the Calumet and Arizona Mining Company. Those who planned and directed the deportation purposely abstained from consulting about their plans either or the law officers of the state or county, or their own legal advisers.

In order to carry the plans for the deportation into successful execution, the leaders in the enterprise utilized the local offices of the Bell Telephone Company and exercised, or attempted to exercise, a censorship over parts of interstate connections of both the telephone and telegraph lines in order to prevent any knowledge of the deportation reaching the outside world.

An army census of the deported men revealed the fact that 433 were married, 199 were native-born Americans, 468 were citizens and 472 were registered under the draft law. Of the foreign born, over twenty nationalities were represented, of whom a relatively small number were enemy aliens. Those who were registered under the draft law were afterward illegally arrested, according to the report, when they sought to return in order to discharge their legal duty of reporting for physical examination under the draft.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA

Gov Carl E Millihon

105 East Twenty Second Street, New York City, N.Y.

The report states that the deportation seems to have been due to a belief "in the minds of those who engineered it that violence was contemplated by the strikers. . . This belief has no justification in the evidence in support of it presented by the parties who harbored it." The significance of this statement is greatly intensified by the turther statement is greatly intensified by the turther state.

neither such fear on the part of the leaders of the deportation as to anticipated violence or evidence justifying such fear was ever communicated to the governor of the state of Arizona with a view to renewing the reing conditions, nor were the federal authorities, in fact, ever apprised that a change of conditions had taken place in the district from that found by the investigating army of federal involves.

The conclusion of the commission, as stated above, is that the deportations were wholly illegal and that action by the proper authorities is clearly indicated:

All illegal practices and the denial of rights safeguarded by the constitution and statutes must at once cease. The right of unimpeded admittance into the Warren dis-

trict of all who seek entrance into it in a lawful and peaceable manner must be respected. The right of all persons freely to move about in the Warren district or to continue to reside within it must be scrupulously observed except in so far as such right in restricted by the orderly process of the

The report is signed by Secretary Wilson, the chairman of the commission, by J. L. Spangler, who represents employing interests on the commission, by E. P. Marsh and John H. Walker, representing labor, and by Felix Frankfurter, counsel.

#### FOR FIFTEEN MILLION RED CROSS MEMBERS

POLLOWING close upon its anonuncement of a nation-wide
"Christmas drive" for membership, the
War Council of the American Red
Cross has issued its first semi-annual report, which shows that the membership
has already jumped from 200,000, when
we entered the war, to \$500,000.

The goal set for the Christmas campaign is 15,000,000. The drive is to start December 17 and continue up to Christmas eve. Effort will be limited practically to securing one-dollar annual members and two-dollar subscribing members. The subscribing member receives the monthly Red Cross Magazine.

Cash collections to date for the war fund, according to the semi-annual report, amount to \$88,000,000. Demands in Europe are increasing so rapidly that, on the present hasis, the \$100,000,000 war fund, it is declared, cannot last much beyond next Spring. Concerning expenditures between May 10 and November 1, the report says:

During this period the War Council appropriated from the war fund \$10,969,216.60 for work' in the United States, as contrasted or work's material war for the state of the sta

The cost of raising and expending the war fund, says the report, is proving to be less than one per cent.

Forty-nine army base hospital units and five navy units have been recruited, organized and equipped. The nursing force now numbers more than 14,000, of whom 3,000 have been called into active service and 2,000 have reached Europe. Millions of women have been organized for Red Cross work in America and the money value of the articles to be made by them during the next twelve months is estimated at \$40,000,000. More than 34,000 women are declared to have completed the first part of the courses of instruction that have been organized throughout the country.

# WHEN SHOP AND SCHOOL

THAT the unprecedented demand for child labor has caused within a year a decrease of 3,000 in the elementary school attendance of a single eastern city is the assertion of Prof. Frank M. Leavitt, of the University of Chicago. The demand is so great that instead of the six dollars a week of three years ago, boys can now make two dollars a day or more. In a statement given out by the National Child Labor Committee, Professor Leavitt says: "Two dollars and seventy-five cents a day is a high hurdle to put in front of a school door. It raises the question in the minds of the parents, as well as the children, as to whether that which the child receives in the school is actually worth as much.

This situation makes very clear the duty of the school and of the community. To quote Professor Leavitt:

First, we should study the situation sufficiently to enable us to prove to the potential working children just what another year or two of education would be worth, and to show them the reason why.

Second, we should give added emphasis to the most practical and effective industrial training in the schools to the end that young people will not only stay in school a little longer, but that such extension of school life will increase their efficiency and their earning power, thus enabling them to give added service to their country later on as the result of added education now.

Third, we should make the greatest possible effort at this time to provide for all clients and the post of the post of the post of the clients and post of educational supervision, through the establishment of part-time classes, day and evening continuation schools and public schools in employers' plants.

The great danger is not so much that children will begin work, as it into their will overwhere the control of the control of the control overtenaic effection. Our problem at this time is not so much to protect children under fourteen from exploitation and from dangerous employments, as it is to protect the potential working children from fourteen to eighteen from selling their birthright, and that unnerewality, for a mess of pottage.

#### THRIFT FROM STAMP LOANS TO GOVERNMENT

N December 3 the post offices, banks, trust companies and many railroad stations, stores and factories commenced to sell the new war-savings certificates issued by the United States government. A single paragraph in the last loan act authorized the Treasury Department to issue two billion dollars maturing in five years in certificates of a maximum of \$1,000 and limited to a maximum issue of \$1,000 to any person at any one time. All details and methods were left to the department to devise, and were actually worked out by a war savings committee of which Frank A. Vanderlip, of New York, is the chair-

During December and January, war savings stamps will be sold at \$4.12 each; for succeeding months the cost will be raised by I cent per month in order to secure a uniform maturity value of \$5, bearing 4 per cent interest, compounded quarterly and maturing in five years. The issue is exempt from taxes and represents the most attractive investment yet offered for those unable to buy liberty bonds or preferring to do their saving in very small amounts with initial and subsequent deposit payments of 25 cents. "Thrift stamps," of the size of a postage stamp, are sold at 25 cents and are pasted on "thrift cards" with spaces for sixteen of them. A card filled up at a total cost of \$4 may, with the addition of 12 cents in the first month and the requisite slightly higher amount later, according to the advancing scale of prices just mentioned, be exchanged for a "war savings stamp," and twenty such stamps will at any time be exchanged for a "war savings certificate" of the value of \$100.

Certificates may be redeemed at the actual cost with interest at 3 per cent if at any time the depositor finds himself obliged to withdraw his savings, only ten days' written notice to a postmaster being required.

Mr. Vanderlip is confident that this simple savings plan will commend itself to the public, and that the whole possible issue of two billion dollars will be sold in a year. His optimism in this respect is based on the experience of Great Britain although, owing to the much lower level of incomes in that country, the total amount of war savings certificates there in a year and a half only came to \$600,000,000.

Under the British scheme, certificates were issued at 15s. 6d., to be redeemed at the end of five years for 20s., i. e., at a rate of interest of about 51.4 per cent. In Canada, a certificate resembling a circulating note was issued. The American plan has the advantage of a fixed maturity, though this entails the greater complication of the price advances for each month.

There can be no doubt that together with the remarkable success of the two liberty loan issues this new facility for saving in small denominations will have a powerful influence on national thrift. As President Wilson said, in an address to the War Savings Committee:

I suppose not many fortunate byproducts can come out of a war, but if the United States can learn something about saving out of this war it will be worth the cost of this war; I mean the literal cost of it in money and resources. I suppose we have several or to spend. We have not known that there was any limit to our resources; we are now finding out that there may be if we are not careful.

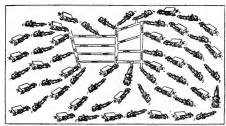

A number of state conventions have been held, especially in the East, to arouse interest in the war savings plan and secure publicity for it. The various liberty loan committees and federal reserve banks are distributing explanatory literature. But many regret that in this, as in nearly every government activity now, those responsible for publicity should have found it necessary to call up the bogey of "pro-German intrigues" against it in order to arouse public

#### REGIONAL TRIBUNALS ON MILK PRICES

WITH graded milk now selling at New York city and similar inflated prices in other large cities, the Food Administration has decided to take immediate action to meet the general discontent among consumers. Insofar as the higher price is due to higher costs of production, the present powers of the national, state and municipal authorities will hardly be able to effect an appreciable reduction. The impression prevails fairly generally, however, that great economies are possible in the cost of distributions.

To investigate the situation and, after hearing, to determine such reasonable prices of milk to be paid by consumers to distributors and by these to producers, allowing for reasonable profits, the Food Administration has appointed a federal Milk Commission for the city of New York and is considering the appointment of similar commissions for other metropolitan areas. The New York commission consists of John Mitchell, state food commissioner; Dr. L. P. Brown, of the city Board of Health; Dr. W. H. Jordan, director of the New York Agricultural Experiment Station; John T. Galvin, New York City Board of Water Commissioners: Mortimer L. Schiff. Mabel Kittredge, Eugene Schoen, New York city; Charles M. Dow, Jamestown. N. Y.; Bradley Fuller, Utica, N. Y.; C. S. Shedrick, Buffalo, N. Y., and Arthur Williams, federal food administrator for New York city.

This commission has begun to hear and consider the evidence presented by all parties having an interest in the question as producers, distributors, manufacturers of milk products, representatives of consumers and of state and

MILK DELIVERIES IN A SECTION OF ROCHESTER, N. Y.

In this small neighborhood, fifty-seven dealers delivered milk to 363 homes, traveling in the aggregate thirty miles. This service could have been rendered by one distributor traveling two miles. A similar situation exists in practically every section of every city.

city governments. The producers and distributors have agreed to make no further price increases while the inquiry is being conducted. The report of the commission is expected not later than January 1.

In Chicago, where producers and dealers were recently brought together for consultation by Harry A. Wheeler, representing the Food Administration, an adjustment was reached whereby milk will be delivered at a retail price of 12 cents a quart. Here the wasteful system of delivery was found to be one of the chief elements in the high price, it being estimated that the cost of handling represents one-half of the total cost to the consumer. The Chicago Health Department suggested that a cooperative system of delivery be substituted for the present competitive system under which a single apartment house often is served by half a dozen milk companies.

An investigation made some time ago in Rochester, N. Y., showed that the work of milk delivery done by 380 horses and 356 men, traveling a total of over 2,500 miles, could be reduced to one done by 50 horses and 90 men, traveling altogether 300 miles, A plan worked out to effect this economy has not yet been put into operation. The National Council of Defense also has taken up the question of wasteful competitive deliveries and requests the state councils to consider the matter.

Other aspects of the milk problem were discussed at length at the recent conference on Food Conservation of the American Academy of Political and Social Science and in the journal (the Town) and special bulletins of the Women's Civic League of Baltimore.

#### VOCATIONAL GUIDANCE AT HARVARD

ONE of the important educational changes brought about by the war is the taking over of the Vocation Bureau of Boston by Harvard University. This is the pioneer bureau for vocational study and guidance in this country. Meyer Bloomfield, who has been its director for eight years, is serving the United States Shipping Board, dealing with the labor problems of shipbuilding.

Under the new title, Bureau of Vocational Guidance, the work will be di-rected by Roy W. Kelly, instructor in vocational guidance in the Graduate School. Declaring that it will maintain all the important activities of the former work, the Harvard bureau an-nounces the following definite aims:

To earry on occupational research and to publish material giving information concerning occupations.

To continue to promote the movement for vocational guidance and to serve as a center

of information on vocational guidance.

To give personal counsel regarding the problems of choosing, preparing for, and entering on a vocation.

To conduct investigations in schools or other institutions, in various lines of business, and in the industries, with a view to determine the need and suggest plans for vocational guidance.

To train vocational counselors for service in schools, in institutions, and in employment

departments.
To continue, so far as opportunity may offer, the cooperation, begun by the bureau through its connection with employment manassociations, in solving vocational guidance problems.

To aid and cooperate with other vocational guidance organizations.

To be of individual and public service in dealing with the questions of vocational guidance arising from the present war.

#### CAMPS AND SALOONS IN KANSAS CITY

HOW complex are the difficulties faced by the War Department in its efforts to clear out alcohol and prostitution from camp and cantonment neighborhoods, two letters recently received by the SURVEY will help to illustrate. The incident referred to by our correspondents is a big football game in Kansas City on a recent Saturday between army and navy, the men of Camp Funston representing the army, and the navy men coming from a station near Chicago, Over 5,000 soldiers were in the city for this game. Says one letter:

Committees representing the leading wom-en's clubs and the Chamber of Commerce and other important business men's organizations here, appealed to the commissioners to close our saloons. . The commisto close our saloons. . . The commissioners refused to do this. It was discovered that there was an ordinance providing that the vavor could close the saloons in the city for forty-eight hours during any emergency, and he decided that this was an emergency and issued a proclamation closing the sa-loons all day Saturday and Saturday night.

The liquor men's attorney applied for an injunction, and Saturday morning, at about eight o'elock, a temporary injunction was issued by Judge Daniel E. Bird, of the Circuit Court, preventing the mayor and the police from closing the saloons.

The liquor interests, continues the letter, secured a postponement of the hearing for a few hours since they had asked General Leonard Wood to appear. The general sent a representative, whose remarks apparently were unexpected:

Captain Osmun, representing General Wood, was present, and, although he was called by the saloon interests, he testified that General Wood and his staff regarded the saloons as very detrimental to the soldiers and desired them to be closed. In spite of this, the judge made the injunction permanent and practically served notice that this would cover Thanksgiving Day because there was already agitation to have them closed on

Appeal from this decision was made to the State Supreme Court. The situation is further complicated by the fact that formerly there was located in Kansas City a temporary camp, Camp Nichols, in which the percentage of venereal disease was high, The order, last August, to close all saloons within a mile of a soldiers' camp, was somehow brought to naught in a short time on the plea that the ruling did not apply to temporary camps, and the saloons reopened. "This action rather discouraged the men in the district attorney's office." comments the letter.

Public health authorities of the region seem to be of sterner stuff. The State Board of Health has passed special regulations looking toward the effective prohibition of and in the zones around Forts Riley (Camp Funston) and Leavenworth. This includes the counties of Geary and Riley and the cities therein, and the county and city of Leavenworth. The health organization has a personnel of eighteen people in each zone-health officers, inspectors and nurses. Prostitutes found infected are quarantined for restraint and treatment at the state penitentiary. About fifteen are at present thus quarantined. A laconic report from the health officer in charge at Leavenworth to the State Board of Health indicates an effective working of the plan:

Four women arrested by the police department in the city of Leavenworth have been turned over to our office for examination. Three were found suffering from venereal disease, and proper steps were taken to secure their isolation.

#### A FRENCH COLONEL ON WINE DRINKING

OLONEL AZAN, a Frenchman recently wounded, who has gone to Boston at the invitation of President Lowell, of Harvard, to help with the reserve officers' training camp and to give a course of lectures at Lowell Institute on The War of Positions, has been interviewed by Elizabeth Tilton as to the drink problem in France as it affects American soldiers. "Tell the American people that they are in danger of making a mistake about our light wines," he

The idea that our French wines, ranging from 10 to 23 per cent of alcohol, are harmless, is worse than nonsense. I have been at the front for months now and have had my men drunk again and again from drink known as our light French wines. The fact is, men are not satisfied with a thimbleful of wine. They drink one bottle, two bottles -before you know it they have really drunk as much alcohol as when they take whiskey, and the result is the same-drunkenness. tell you, drunkenness at the front is an abomination, and if you want to prevent it you have got to stop wine drinking just as much as distilled liquor drinking.

As there is not sufficient lumber in France to build barracks for the American troops, many of them will have to be quartered with the French people in their cottages and the cottagers customarily have both wine and fruit brandy at hand. The natural thing and the hospitable thing to do will be to ask the visiting Americans to have a drink. On this point Colonel Azan said:

It is imperative that your men shall be able to say, "The commander-in-chief of the American army has forbidden me to drink any wine, beer, dider of sirildel filiguor while in France. A good soldier is obedient; therefore I cannot drink with you." The French love military obedience, and in a few days they will say, "Don's ask the American boys to drink—it make them disboy their word of the control of the control of the control will be the control of the control of the control of the soldiers." We want them to be obedient

In the towns where the Americans go on furlough, I believe the French commander of the place and the American commander of the place should post a notice saying that the American troops are asked by their commander-in-chief not to drink any wines, ber, cider or divilled liquors, therefore we ask every merchant in town not to sell any al-cobolic beverage to them. If any man does sell to them, we ask the mayor of the town to close his saloon, and we suggest that the commander would place a sentry in front of

As a matter of international courtesy, the Frénch people will bow to the total abstinence of America, for in their hearts they know it is the only way to get any efficient treatment of that military abomination—drunkenness.

Asked as to the rum ration given to soldiers just before they go over the top, Colonel Azan said:

There are boys who are afraid to go over the top. The idea is to give shem a drug to death, and the state of the state of

#### AN EASTERN NON-PARTISAN LEAGUE

A T a meeting held on November 26 in New York city, which was attended by farmers from many parts of the state and representatives of farmers' associations, the Farmers' Nonpartisan League of the State of New York was established. The invitation to this meeting had been issued by John J. Dillon, chief of the state Bureau of Foods and Markets.

This is the first eastern extension of the farmers' campaign against the middleman and earrier which during the last two years has sweet over the northwestern states. A. C. Townsley, president of the Non-Partisan League of Dakota, after attending the conference of the American Federation of Labor at Buffalo, came to the city to take part in the organization of the state league and to address a number of meetings.

One of these meetings took the form of a joint conference of consumers and producers on the present food situation and was held at Cooper Union under the auspices of the labor bodies of the state. It was the first large meeting in the East at which the purposes and methods of the league were popularly described, and at which farmers and labor men pledged themselves to work together for the organization of a more direct connection between producer and direct connection between producer and

Courtesy of Judge, Copyright Leulie-Judge Company

"NO NEED TO STOP, SANTA!"

consumer. John Mitchell, the state food administrator, who presided over this meeting, pointed out that, whatever the fortunes of the war, food prices cannot for a long time return to the level of 1914.

Many of the speeches, of both farmers' and labor representatives, emphasized the need for public ownership of the machinery of distribution, from grain elevator to city market. A resolution was adouted

That the producers and consumers of the conference who in the past have been kept apart by cunning middlemen, politicians and their agents, bring their influence to bear on all citizens' food councils in which they participate toward representation of some kind from both the producers and consumers.

A committee of ten, appointed to aid the new league in working out a legislative program, is equally divided between fammers' and labor representatives, the former consisting of one delegate each from the State Grange, the Dairymen's League, the state Fruit Growers' Association, the state Vegetable Growers' Association and the state Agricultural Society, the latter consisting of a member of the American Federation of Labor, two from the state Federation of Labor and two from the Labor Food Conference.

One feature which the New York Times, in a long leading article, derides as hypocritical but which seems in harmony with the undoubtedly genuine patriotic sentiment at the Buffalo meetings of the American Federation of Labor, as described last week in the SURFEY, was the frequent and emphatic expression of loyalty on the part of the speakers, both farmers and trade unionists.

# ANOTHER ACQUITTAL IN THE MOONEY CASES

IT took just twenty minutes for a jury in San Francisco last week to acquit fendants charged with complicity in the Preparedness Day bomb explosion to be tried, and the second to be acquitted. Mrs. Mooney, wife of Thomas J. Mooney, who is under sentence of death, was acquitted last summer [the SURVEY for AUGUST 25].

This leaves the situation in San Francisco in a curious state of tangled contradiction. Mooney was convicted and sentenced to be hung on the testimony of F. C. Oxman, who swore that a short time before the explosion he saw Mooney and Billings place a suitcase at the corner of Steuart and Market streets, the scene of the tragedy, having ridden down Market street in an automobile driven by Weinberg.

Later Oxman was proved to have written to a friend in Illinois offering to pay his expenses if he would come to San Francisco and corroborate his story, and he was dropped as a witness. He did not tell his story in the Weinberg trial, yet if it is true Weinberg, who was acquitted, must be equally guilty with Mooney, who is under sentence of death.

The present situation as to the five defendants is as follows: Warren K. Billings, the first defendant to be tried. was convicted and sentenced to life imprisonment and was taken to Folsom prison two weeks ago to serve his sentence. Thomas J. Mooney, who was sentenced to be hung last May, is still in jail awaiting a final hearing before the Supreme Court on the appeal of his attorneys for a new trial. The President's commission of which Secretary of Labor Wilson is the chairman, have been making an investigation of the Mooney case and have examined elaborate briefs which were submitted to them by the attorneys in the case. It is not known whether their investigation which was completed last week will result in any public report. Mrs. Mooney and Weinberg, both of whom have been acquitted, are still being held, although it is not believed that the other indictments against them will be pressed for trial. Edward Nolan, the fifth defendant, and the only one not yet tried, is out on bail.

A campaign is now on in San Francisco for the recall of District Attorney Fickert. Recently Mr. Fickert has announced that the issue is between "partitotism and anarchy" and the papers supporting him have published a relegran said to have been sent to the district attorney by Theodore Roosevelt which in part is as follows:

I am informed that an effort is being made to recall you because you have successfully prosecuted the anarchists who during the Preparedness Day parade killed ten persons and injured sixty others.

If such be the fact, I not only feel that the issue between you and your opponents is that between patriotism and anarchy, but I also feel that all who directly or indirectly assail you for any such reason should be promptly deprived of their cirizenship.

The San Francisco Bulletin has published a telegram from Alexander P. Moore, of Pittsburgh, stating that he had requested Colonel Roosevelt to endorse Fickert "because it was represented to me that he was being opposed on account of his activity in connection with the prosecution of the I. W. W."

# THE NATIONAL CATHOLIC WAR COUNCIL

IT is known that when the plan of mobilization and training for the army was decided upon the Knights of Columbus asked for and obtained the right to develop in the larger field the experience they had gained during the occupation of the Mexican border. When their first million dollars had been spent or contracted for, they saw the necessity for spending two millions more. And while they were engaged in this work it was seen that numerous other fields of action were opening up which commanded the attention of the Catholic Church.

In August there was assembled in Washington a convention of delegates from sixty dioceses, together with the heads of national Catholic societies and the editors of all the Catholic papers, who organized the National Catholic War Council of the United States, of which the executive committee should comprise one clerical and one lay appointee of each of the cardinals and archbishops, together with the heads of the Federation of Catholic Societies and the Knights of Columbus. Later it was decided that the archbishops themselves should become the National Catholic War Council, the original organization continuing as the working body. This last step gave the final and unmistakable stamp of the church's interest and approval, and will conduce to a speeding up of the organization in all parts of the country.

The council has undertaken to follow the fortunes of the Catholic soldier wherever he may be and to engage in all works which may contribute to his welfare.

A first and essential concern is for the provision of chaplains. It would appear that in some camps the Catholics approximate 35 per cent of the total, and the concern has been to find priests enough to minister to so large a number. The Committee on Chaplains has asked each diocese for its quota, according to population, and the young priests as they volunteer have been presented to the War Department through the Rev. Lewis O'Hern, attached to the College of the Paulist Fathers at the Catholic University, Washington. More recently Bishop Hayes, of New York, Itas been

appointed chaplain-general and will have the special care of priests in the service as chaplains. Another church dignitary will probably accompany the troops overseas in the same interest.

Scarcely any diocese has priests to spare, but a means has been found to meet the need by ordaining the divinity class of 1918, these young priests being fitted into the places left by their elders who have volunteered for service and been accepted. Nothing will be left undone to ensure that priests are available for the administration of the sacraments to Catholic soldiers going into

able for the administration of the sacraments to Catholic soldiers going into battle or at the point of death. Where there are not enough commissioned chaplains, volunteer auxiliary chaplains make up the deficiency.

The Catholic University has undertaken to provide a course of training for service workers engaged in the Knights of Columbus halls or elsewhere. The workers in the camps will all have the opportunity to take this course.

At the request of the National Catholic War Council, Catholic societies in communities near the camps and in all large cities are opening their club premises to men in uniform; and where service clubs are required in the neighborhood of large stations these are being provided. Similarly, Catholic women's societies have been encouraged to coordinate their efforts with special reference to protecting girls and providing hostess houses at which the men may meet their women relatives. These societies also actively cooperate with the Red Cross and the Food Conservation Bureau. Committees are organized, with the St. Vincent de Paul Society as the basis, with the soldiers' and sailors' families as the immediate object of concern, and other committees for the study of after-war necessities and other of the later phases of helpfulness.

The unit of organization is the diocese. Once established, the diocesan councils, composed of the leaders of the Catholic community, meet weekly, and the whole range of activities comes un-This does not prevent der review. special work from being undertaken, as for instance when the League of Catholic Women take their share of Red Cross work under agreement with the Red Cross, or when the Chaplain's Aid Society arrange to provide chaplains on duty with all requirements for themselves and literature and religious articles for the men. Cardinal Gibbons is president, and the Rev. John J. Burke, of the Paulist Fathers, New York, chairman of the executive committee.

# THE ARREST OF NICHOLAS HOURWICH

PRACTICALLY no publicity has been given by the newspapers to the arrest in Bridgeport, Conn., on Novem-

her 18, of Nicholas Hourwich, the son of Prof. Isaac A. Hourwich. a well known writer and lecturer and the author of several books on Russian life, on a charge of treason and to his subsequent restraint in the local jail there without bail. The circumstances surrounding Mr. Hourwich's arrest have been such as to induce the Bureau of Legal First Adi of New York city, one of the purposes of which is to protect individuals in the exercise of their constitutional right of free speech, to interest itself in his behalf.

Mr. Hourwich went to Bridgeport to address a group known as the Union of Russian Mechanics. This organization, according to Professor Hourwich. has as its object the "preparation of Russians in this country efficiently to protect and serve their native land." It has branches in New York city, Philadelphia, Cleveland and Bridgeport and a membership of 800. It is not connected with the labor union movement but was organized by the Russian Immigrant Aid Committee, which in turn is declared to have been formed by members of the official Russian mission to this country.

According to those who have looked into his case for the bureau, Mr. Hourwich confined his lecture to the objects of the union and to instructing its members on topics of general interest to them. Both he and his father have always been interested in the affairs of Russians. Nicholas was formerly connected with the Iewish daily, Novi Mir. published in New York city, the second class mail privileges of which have recently been withdrawn by the United States post office, and Professor Hourwich is now connected with another Jewish daily, the Day. A number of those who heard the son on this occasion have testified that nothing that he said could be construed into criticism of this government in its war policy.

Nevertheles, at the end of his speech he was informed by a lieutenant of the local police force that he was under arrest. Nine of those who accompanied him to the police station were arrested also, but later all but three were released. Mr. Hourwich, it is declared, has been held in a cell in the Bridgeport jail practically incommunicado ever since. Bail has not been fixed, no warrant has been served upon the prisoner, and the latest information forthcoming at the time the SURVEY went to press was that he was being held for the grand jury on December 7.

A statement concerning the case issued by the Bureau of Legal First Aid declares that "those who accuse Hourwich do so upon information obtained from ignorant men, some of whom are Poles without knowledge of the Russian language, whereas the whole of Hourwich's speech was delivered in Russian."

# **Book Reviews**

THE FOOD PROBLEM

By Vernon Kellogg and Alonzo E. Taylor. Macmillan Company. 213 pp. Price \$1.25; by mail of the SURVEY \$1.35.

THE HIGH COST OF LIVING

By Frederic C. Howe. Charles Scribner's Sons. 275 pp. Price \$1.50; by mail of the SURVEY \$1.62.

Between them, these two books cover all the important points in the present food situation. In the first-named, two members of the Food Administration gives a remarkably lacid and convincing picture of the wind possible, they lift out of the realm of controversy between conflicting interests. Mr. Howe, on the contrary, tries to lay bare hidden economic motives and ambitions and pursues the causes of under-print origins in the organization of society for profitering and exploitation.

It has been said of the Food Administration that in its aim to conserve as much food as possible for our allies, it has adopted too uniform a propaganda as between differparts of the country. It is, of course, difficult for a national authority to enter into all the nooks and crannies of so complex a situation as the present high cost of living and possiever, that it is not oblivious to the importance of these differences. The psychology of nutrition, with all that it implies, is discussed at length, and Mr. Hoover himself, in a calories, balanced protein, fast and carbohydrate does not make a satisfactory dict.

The mention of these nutritional elements leads one to observe that the second section of the book, entitled The Technology of Food Uses, gives a popular exposition of the most widely adopted modern theory of nutrition such as every speaker and writer on food conservation should carefully study to exceed the second of the conservation should carefully study to exceed the second of the second

claim age getting adjustment of adjustment of the End describing the method through a diptied and the End describing to the method through a diptied to the cooperating organization, take timal and local, to whose efforts they attribute much of the success of the work. Of special interest is their full account of the food control systems of England, France, Italy and Germann, and their reasons for the adoption or rejection of certain of these plans here, as the case may be the case may be the case may be the same plans here, as the case may be the case may be the same plans here, as the case may be the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here, as the case may be the same plans here.

Among the many excellent incidental hins, we should like to single out for mention the insistence of the authors on the need for strict enforcement of pure food laws, in spite of the many circumstances which renamed the strict enforcement of the prople. They point out that the need for reducing transporation must increase the price of standard articles with the result either that the quality of brands in common demand is to submitted for them lesser known grades and ungraded products.

The only item in the detailed recommendations to which the reviewer finds it difficult to assent is the advice to those of means to subsist as far as possible upon the "rare, expensive goods, delicacies, if you please," in order to release more of the cheaper foods for the poorer classes and for export. Does not this leave out of account the greater amount of the nation's labor resources absorbed in the production and marketing of the high-priced commodities? And is it not a common experience that encouragement to use these delicacies leads to over-feeding rather than substitution?

THE High Cost of Living approaches the subject from a very different angle. Early in the book, the reader is introduced to the outstanding facts bearing on the present problem—the rapid increase in the price production, the discouragement of farmers, the rural exodus, and the alarming relative increase in tenant-farming under conditions making for exhaustion of the soil, underwitten of the production of the soil, underwitten of the production of the soil, underwitten of the present tenance of the production of the soil of the production of the production of the soil of

Food production per capita in the United States is falling, and this in spite of high prices (paid by the consumer) and a real hunger for land. One of the principal reasons Mr. Howe finds in the intolerable conditions imposed upon the farmer by those who can control either the actual movement is, the renaporation companies and the produce exchanges which manipulate market prices in the interest of middlemen.

In his wholesale condemnation of tenancy farming the author goes too far. If it "is impossible to have a healthy agriculture time to the farming health and the farming humans the unmixed blessing to the nation which Mr. Howe gives his readers to understand. The Belgian peasant A majority of English tenant farmers prefer to remain tenants and invest their capital in the farming business rather than in land. (The farm owner benefits from rising land (The farm owner benefits from rising land ecases to be a farmer.)

This generalization apart, the author undoubtedly makes his point as regards the particular dangers of the present short farm tenancy system of the United States to the economic future of the nation. It would be difficult to devise a system more oppressive, more discriminatory against the producer, or more effective in discouraging good hus-

Some of Mr. Howe's recommendations are for organized collection and storage of farm produce under the control of state departments of markets and collective marketing; terminal markets owned by state or city, with adequate cold storage and refigerator provision and public suctionerting under state tion of milk distribution or public milk-receiving stations delivering to local depots for retail sale over the counter; promotion of

cattle raising near the principal consuming centers; expansion of parcel-post into a fooddistributing agency; national purchase and operation of express, refrigerator and package freight cars. All this is in addition to more fundamental changes which he advocates to free the access to land, such as land taxation, direction of immaigrants, opening trading in futures and extension of rural credits.

Librations many suggestive detailed recommendations is one for a national cleaning house or bureau of information to which the would-be farmer could go for absolutely trustworthy information on all the conditions affecting the success of agriculture in any region where he may contemplate to purchase land.

BRUNG LASKER

SURGICAL NURSING IN WAR

By Elizabeth R. Bundy, M.D. P. Blakiston's Sons & Company. 184 pp. Price \$.75; by mail of the Survey \$.80.

Often it has been said since the war opened that the experience of a surgeon in civilian practice is not sufficient to meet the emergencies of "the field." And special course, brief at first, but later in detail, were given at vantage-points in every country in order at vantage-points in every country in order of watching for new conditions of wounds and symptoms of infection, operating by candle-light if a bomb happens to put the electricity out of service, deciding instantly which of many immediate calls is the most immediate, how to utilize a valable material.

But equally new experiences face the nurse who goes abroad, and the aim of Dr. Bundy's book is to group in a few pages some of the most important conditions for which she must important conditions for which she any aitempt at completeness, since "new methods are daily devised and reported." But she calls for the best possible preliminary training; then upon this builds her special instruction regarding effects of misoliance and secular injurity.

pliances and peculiar tnjuries.

Of great value to the trained nurse who
is going into war service, the book should
also be a wholesome deterrent to the earnest
but unprepared.

G. S

YOUR PART IN POVERTY
By George Lansbury, B. W. Huebsch.
126 pp. Price \$1; by mail of the SURVEY

\$1.08.

MADON, prompts the fine lady representatives of the idle richt og jev loy rides to the convalencent Tommy? It can't be the Tommy himself, for when he was mainted in her factory she never knew of it, or, if she did, gave him no thought. And she doesn't give joy rides to his overworked, harrowed, half-sawed wife; or on his emaciated, half-naked, mirrhless children. Is if the dayming of a new conscience? Is if

If she and her kind would read Mr. Lansbury's book they would learn that the war with Germany is not their only problem. There is another task awaiting the powerful. And "in our march forward we shall no widows, orphans or drivasted homes; but, instead, as we succeed in destroying evil in our own lives and in calling men and women to repentance and hope, we shall be analy, for they will each be brought to see the sacredness, the heauty and nobility of all life, and made to understand that personal calvation is of little worth unless it is accompanied by the salvation of one's fel-

The problem of the poor and suffering is personal to many of us who take it as a matter of course. We are wrong in attributing it to some vague thing separate from ourselves. The well-to-do should preach a gospel of discontent with poor ventilation and filth. It is a crime to teach contentment with such conditions on the assumption that they are God-ordained. But before we teach discontent we must make sure that our own discontent we must make sure that our own skirts are clean. We are too much inclined, as Tolstoy said, to do everything for the poor except get off their hacks. Mr. Lanshury has written a penetrating

statement. But it is written in such a kindly way that one must wonder at his moderation. He knows the poor and their problems, and he knows where the trouble lies. But he does not attack those who are responsible. He pleads with them to see the joy of life for all as the only effective avenue to real joy for any.

He might have said that a fool's paradise is surrounded by those who created it and to whom it helongs. If they are allowed no share in it, they will sooner or later take it all.

EDWARD T. HARTMAN.

THE TAXATION OF LAND VALUES (Hart Schaffner & Marx Prize Essays in Economics), by Yetta Scheftel. Houghton Mifflin Company. 489 pp. Price \$2; hy mail of the SURVEY, \$2.14.

Never in the world's history has the sub-ject of taxation assumed such importance as within the last few months. And its importance is not likely to wane in the very near future. Miss Scheftel's book, which is the twenty-second of the Hart Schaffner & Marx Prize Essays (this one winning \$1,000), is a valuable contribution to the literature on taxation experience, and is thus most timely.

The hook deals with the different forms of land taxes and differentiates between the tax on land value and the single tax. The single tax is epitomized as "the one hundred per cent tax on land value and the abolition of all other taxes," while the tax on land value, as dealt with in the book, is a much smaller levy "adopted in part for fiscal purposes, in part in the interest of social amelioration; e.g., to relieve congestion in urban communities, to prevent speculation in land, and, on hehalf of the community, to appropriate a little of the enormous appreciations in the value of the land, to meet the growing hudgets." The latter system does not include the doctrine of abolishing all other taxes.

A large part of the hook is devoted to a careful description of the special land taxes which in the last half century or more have which in the last hair century or more have been adopted in Australia, England, Ger-many and western Canada. The causes for the introduction of the tax in the various countries, together with the nature and the working of the systems, are discussed ex-haustively. The expediency of the tax on land value for the United States is also considered, and attention is given to the tax in its fiscal aspects and as a measure for social reform.

The author's conclusions appear to be that the tax on land value has thus far proved inadequate as an effective force for social hard-to-ascertain tendencies toward hringing desirable reforms, and that certain considerations of fiscal improvement tend to urge the extension of the land tax.

The book is a veritable storehouse of information for those interested in the subject and a valuable help toward improvement in methods of taxation-a field of government activity where improvement is urgently needed.

SHELDY M HARRISON

POLITICAL HISTORY OF POLAND OLITICAL HISTORY OF POLAND By Edward H. Lewinski, Corwin. The Polish Book Importing Co., Inc. 628 pp. Price \$3; by mail of the Strever \$3.15.

The President of the United States, speaking last January in behalf of a "united, in-dependent and autonomous" Poland, contributed greatly to showing the need of an understanding, on the part of the American people, of the life and aspirations of the Polish nation. Dr. Lewinski-Corwin is conspicuous among several scholars who have sought to satisfy that need. And it may be said that, after making due allowance for three serious limitations on his work, he has succeeded better than anyone else.

The first of these limitations is to be found in the nature of the work. It is frankly propagandic. It is an apology rathtrankly propagandic. It is an apology rather than a confession. Though "based especially and largely on Polish sources of information," It is untrammelled by citation of authorities or other apparatus of scholarship. It freely and naturally exalts the antique Polish state and glorifies the present Polish people. It is thoroughly nationalistic.

Again, as its title indicates, the work is a devoted to the economic and social evolution of the Polish nation, but a multitude of kings and ministers and nobles jostle one another for prominent places on the packed pages. On the whole, both selection and proportion are admirable, though at times the profusion of obscure names evokes a

In some instances the author might have prevented the flagging of his readers' interest had he been less ready to limit himself to Polish annals and more willing to illustrate the significance of Polish events hy reference to contemporaneous developments in other countries better known to American students. For example, a detailed comparison of Poland and Germany in the seventeenth and eighteenth centuries would have heen distinctly worth while; among other advantages it would have demonstrated the utter asininity of Prince Bulow's recent assertion that Prussia was obliged to appropriate a third of Poland hecause the Poles for two centuries had been unable themselves to evolve a strong, forceful state. Likewise, there might well have been a chapter com-paring Poland and England in the seventeenth century, for the constitutional ten-dency which, when applied to the latter, is praised as liberty, is, when applied to the former, condemned as "anarchy."

A third limitation on this work is, curi-ously enough, a depreciation of the influence

of the Catholic Church on Polish history. is as if a historian of Ireland or of Quebec should write some 600 pages without discussing in either case the nationalistic contributions and propaganda of its Roman clergy. Notwithstanding the fact that Catholicism is as much a distinguishing badge of patriotism on the Vistula as on the Shan-non or on the St. Lawrence, Dr. Lewinski-Corwin endeavors everywhere to separate political aspirations from religious emotions. How odd it is for a Polish patriot of today to sympathize with Protestants in the story to sympathize with Protestants in the sour of the Reformation and to vie with eighteenth-century rationalists in denuncia-tion of the Jesuits! What Polish Catholic priests have done in the nineteenth century for their compatriots both in Russian Poland and in Prussian Poland, might fairly have been told. Towards the Jews the author is generally more kindly than towards the Catholic clergy, yet even here he must needs condemn "the liberality of the Polish law" as conducive to "the perpetuation of a dis-tinct race consciousness" and as preventing polonization and nationalization" of the

If due allowance is made for these three limitations, Dr. Lewinski-Corwin's book takes its place as the hest and most authoritative brief history of Poland now on the market. It is well illustrated by numerous pictures and maps and is provided with a very useful key to the pronunciation of Polish names. Especially to be commended are the accinerate are the sections on the relation of Lithuania to Poland and the chapters on the old Polish constitution and on the newest developments -Constitutional Russia and the Poles, and The Polish Question and the Great War.

Thanks to Dr. Lewinski-Corwin, every interested American can now learn that land, with a land heritage of three-fourths of a million square kilometers, with a historic past 1000 years old, with a rich civilization, with a beautiful language and litera-ture, with an annual economic production amounting to several billions, with a robust and virile population of 25,000,000 Poles, of whom almost 2,000,000 have been called to arms in this war-is not a fragment; that it is a great nation, one of the few great nations of Europe and of the world." And, in this present war, while Americans are fighting in Europe for the rights of nations, what American is not interested in the subject of this book? CARLTON L. H. HAYES.

# Communications

#### THE EPISCOPAL FUND

To the Editor: Permit me to call your attention to an inaccuracy in your editorial under the head of Sustentation Funds for the Ministry, in your issue of October 27, in which you say "the Protestant Episcopal Church has raised a fund of \$5,000,000." That fund up to the present time amounts to something over \$8,700,900. I wonder if you would be good enough to mention this fact in a later editorial. Pittsburgh.

#### AGNES C. WAY.

SAID OF THE SURVEY To THE Entron: In the face of so much protest against everything these days, may I say that I have been heartily in accord with the SURVEY in this difficult time of knowing what to say.

I was particularly glad for your article on

Sabotage and Loyalty, October 13. It is so refreshing to find someone giving credit where it is possible in these days of so much unjust criticism.

Toledo ANNE M. SPRAGUE.

To THE EDITOR: I want to express my keen appreciation of the SURVEY and of its invaluable assistance in keeping in touch with the most recent information along all lines of social welfare. When Making the Boss Efficient appeared [the SURVEY for June 2], I cut it out and kept it going among people who were deeply and personally interested in the gross injustice of the "hiring and firing" system of employment in the teaching pro-fession and especially in higher institutions of learning.

Professor Cattell's experience is serious,

but at least he knows why he was dismissed. There have been recent cases in this state where scholarly, efficient men and women have been dismissed at the end of the school year without warning, with a vague explanation or none at all, refused a hearing or opportunity to disprove charges. A board of portunity to disprove charges. It waste or trustees, political appointees, and the gov-ernor who appointed them, refused hundreds of requests for a hearing, made by some of the best chizens in the state.

Every good citizen in this country is thinking, talking, working, sacrificing for America and the cause of the allies. There is now no room for anything but whole-hearted loyalty and support of our government, but it is also a time for a searching of conscience in our own personal and husiness relations to see whether the principles of autocracy or democracy characterize our acts. May the time come soon, in this period of great awakening, when the principles of justice, cooperation and fair play will characterize the teaching profession as well as our great industrial organizations.

Please send the reprint of Making the Boss Efficient. I shall keep it moving about where it will do good work.

#### A SEATTLE SHEPHERD

To THE EDITOR: A certain clergyman of the city of Senttle recently expressed himself, in the columns of the SURVEY [October 20, page 75], in the strongest terms against the Industrial Workers of the World.

This clergyman, whose activities are well I his clergyman, whose activities are well known to the people of Seattle, used the term "damnable" (a favorite word of his) in connection with the I. W. W. He has used this same forcible word in referring to others not so reprehensible as the Industrial Workers of the World. For instance, he applied this term some months ago to those whose only crime is that their patriotism is of another stamp than that of, let us say, Mayor Mitchel. This Christian clergyman vehemently asserted that these men should be taken out and shot.

be taken out and shot.

Did it ever, by any chance, occur to this
"reverend" gentleman that the term "damnshle" (it is a good word, a very good word)
might he more truly applied to those whose
failse teachings and ignorance of God and
His ways have brought upon us the menace
of the i. W. W. and many other ills that at
present afflict our nation? Does this man
present afflict our nation? Does this man
being like an alien growth, like a meterotic
that is found in a field, but has come from
the stars and has no affinity or relationship to the stars and has no affinity or relationship with the other houlders lying in its neigh-borhood? If he thinks thus he does not know what even the American habes know today.

When boils and sores appear upon a man's body they indicate that the blood is impure or poisoned in some way. How do we go about to cure these boils? By lancing them and applying unguents? That will afford only temporary relief, and the sores will be certain to break out again sooner or later. In order to cure the man we must build up his general health, purify his blood, and put him in a sound physical condition. The boils and sores will then disappear. The Industrial Workers of the World are

The Industrial Workers of the World are a festering growth upon the body politic. But they have appeared as a festering growth because the body politic itself is sick.

Despite all efforts to suppress them by police, military, or ecclesistical coercion, there "strong arm" methods will not succeed. The 1. W. W. will continue in this country just as long (and no longer) as the body politic is in a corrupt and weakened condi-tion. The I. W. W. is a symptom, and not a disease. It is one of the symptoms (there are many others) that reveal the deadly state of the moral and religious life of the nation.

# Fancy Table Linens for Holiday Gifts

Practical, distinctive, and moderate in price, characterizes our stock of Fancy Linens gathered from almost every country of the globe.

Nothing has been left undone to make this collection the most complete we have ever shown.

Luncheon Sets (twenty-five pieces to a set), round, square, oval, and oblong, in Irish, Swiss, Madeira, and Chinese Embroidery, \$7.50 to 175.00 per set. Mosaic Open-work, Italian Needle-point, Sicilian and Fayal Drawn-work, \$31.50 to 275.00 per set.

Tea Napkins, Madeira Embroidery, \$5.50 to 17.50 per dozen. Sicilian, Fayal, and Mosaic Open-work, Lace and Embroidery, a most interesting collection, \$10.50 to 65.00 per dozen. Luncheon and Dinner Cloths, in Italian Needle-point and Embroidery in a variety of exquisite designs, round and oblong, \$57.50 to 575.00. Many have Napkins to match.

Scarfs of every size and description, Embroidered, Lacetrimmed, Porto Rican Drawn-work, Sicilian, Mosaic, etc., \$1.50 to 175.00 each.

Tea Cloths, round and square, in almost endless variety, \$3.50 to 350.00 each.

Tray Cloths, a beautiful collection of Lace and Embroidered. oval and oblong, 35c to \$22.50 each.

Hemstitched Damask Luncheon and Dinner Sets, two to four yards long, two and two and a quarter yards wide, \$13.50 to 65.00 set of Cloth and twelve Napkins.

Round Damask Cloths, Scalloned, in handsome new designs, 72 inches, 81 inches, and 90 inches diameter, \$6.00 to 22.50. Napkins to match, \$10.00 to 25.00 per dozen.

# James McCutcheon & Co.

Fifth Avenue, 34th & 33d Sts., N. Y.

It is because the prophets and the priests and the rich men and the great of our country have not been true to their trust as lead-ers of the people that the I. W. W. has broken out, like a cancer, upon our national life. The ministers are placed at the head to lead the people, as the head sheep of a flock leads all the rest. If the ministers nock leads all the rest. If the ministers teach falsely, then all the people who follow them are led astray to ruin, just as a flock is led to destruction when the leading sheep jumps over a precipice.

The prophet Isaiah calls over the cen-

turies to the ministers of this generation: The ancient and honourable, he is the head: and the prophet that teacheth lies, he is the tail. For the leaders of this people cause them to err; and they that are led of them are destroyed." And Micah says to them: "Therefore night shall be unto you, that ye shall not have a vision; and it shall he dark unto you, that ye shall not divine; and the sun shall go down over the prophets, and the day shall be dark over them." Seattle.

CHARLES HOODER

#### THE SOCIALIST VOTE

To the Editor: In your issue for Novemher 10 you allude briefly to the Socialist vote in the recent municipal campaign and appear to express the view that about one hundred thousand of the votes cast for Mr. Hillquit should be regarded as strictly Socialist votes. Of course, opinions may well differ as to what is a strictly Socialist vote, but I think

A synopsis of one of a course of three tectures the SCIENTIFIC AND PRACTICAL WEL-RE WORK FOR THE DELINQUENT GIRL FARE WORK FOR THE DELINQUENT GIRL is set forth in a folder just issued by MRS. MORTIMER M. MENKEN. Graduate of John Cottier's Tratning Schoot for Community Work-sra. Apply 149 W. 77 St., New York. that your comment has probably given to many readers the impression that in the neighborhood of one hundred thousand Socialist Party members in New York voted for Mr. Hillquit and the issues which he

advocated.

The Socialist Party membership in the entire United States is at the present time much less than the supposed number of Socialist votes cast for Mr. Hillquit and his policies. I am competently advised that the Socialist Party membership in the entire United States on October I was only about eighty thousand, the average Socialist Party membership in the United States during the preceding five years having been ninety-four thousand.

On April 30 of this year the party membership in the United States was 61,594 (as indicated by the sum total of dues paid into

indicated by the sum total of dues paid into the national office that month—viz. \$3,079.70). Of the eighty thousand Socialist Party members in good standing in the United States on October 1 of this year hardly twothirds were voters, the Socialist Party admitting to full membership non-citizens as well as citizens, minors as well as adults, and, of course, women as well as men. It might be of interest to you to ascertain the number of Socialist Party members in

good standing in New York city on election day, and to endeavor to form a reliable estimate of the proportion of the good-standing mate of the proportion of the good-standing members who were eligible to vote in the re-cent election. I think if you pursued this inquiry far enough, you would find that con-siderably less than forty thousand Socialists of good standing in their party voted for Mr. Hillquit and his anti-war policy in the last election. That the additional hundred thousand votes cast for his policies were chiefly pro-German and pacifist votes, would be, I think, a fair inference

J. G. PHELPS STOKES. New York.

[The sentence to which Mr. Stokes refers reads as follows: "As to the Socialists, the party vote in Mr. Hillquit's 142,178 was over 100,000. So far as party organizations are concerned, this makes it second in numbers in New York city, only the Democratic (Tammany) exceeding it." The use of the word "party" in this connection is misleading; we should have said "straight" votes-that is, votes for the entire tieket. The intention was to point out that more than 100,000 hallots were east for the whole ticket, which seemed to us even more striking than that 142,000 had been cast for Morris Hillquit,-EDITOR.

#### VENEREAL DISEASE IN FRANCE To THE EDITOR: Some weeks ago there was

an article in the SURVEY expressing fears regarding the conditions under which Ameriean troops will be living and fighting in France. It was my privilege to obtain recently the following statement from an officer in the French army, who is now doing special work for our army in this country. As he would have to obtain permission, which might take weeks, to allow the use of his name, I am not giving it to you, but the information that he gives seems entirely

If you eare to publish the inclosed statement, it may serve to allay the fears of the American people, as it shows an important

WANTED - ENCYCLOPEDIA. boys' and girls' clubs of Greenwich House (social settlement) need a good encyclopedia. Will some one who has two, or some family that is breaking up housekeeping. contribute one for the use of the club members, many of whom are working boys and oers, many or whom are working boys and girls who attend night school? Address Harrison Thomas, boys' club leader, 27 Barrow street, New York city. 'Phone Spring 9833. change of attitude by the French government toward the whole question of venereal dis-eases. The inclosed is an exact copy as given to me by this French officer.

While conditions existed at the beginning of the war which resulted in the increase of venereal disease in France, the French gov-ernment has within the last few months taken several steps to deal effectively with the evils.

"The sale of all alcoholic liquor to men in

uniform is strictly forbidden. Light wines

"As to this last point, the French govern-ment, in connection with the American army, has made it clearly understood that this last privilege would immediately he taken away if it were abused and this ruling has already been put into effect in regard to champagne, in which some of the American soldiers landing in France indulged without enough re-

"The government has also taken steps to suppress the prostitute around army camps in the French army. Commanding officers are the judges of rulings necessary in regard to this. The growing tendency is complete probibition on this subject. This means that no organized evil should be able to surround our boys in camp. As for the larger cities, soldier who has been invited to spend his leave-of-absence in a home of reputable families who write to him a letter to that effect, letter O.K.'d by the police commissioner of the district as to the standing of the person extending the invitation. soldier has no friends or relatives to invite him, he will be treated by such organizations as the Army Y. M. C. A., who will provide bim with a good time, either in a town organized for that purpose or in Paris under proper supervision. The only time the soldiers will be free without leave in France will he a very few hours in the evening when they are at rest (from 5 or 6 to 8 o'clock P. M.) and on Sunday. Physical eleanliness among the boys in the fighting units is today of a much bigber standard than ever before.

"The danger of what is being called the 'crazy kid' problem, such as has been occasionally seen around certain eamps in America, is practically unknown in France, as the French girls between twelve and seventeen years old are very much under their mother's supervision.

"The most important share of the work is really done by the Y. M. C. A., which bas official welcome not only by the American officials, but also by the French government, and is given all facilities to do its work For one French regiment, when the Y. M. C. A. was opened in the town, where it went to rest, the proportion of petty troubles and punishments fell 95 per cent.

"The real difficulty comes from the fact that the American boys are so highly paid They have too much money, but educational work among the boys themselves and the provisions of the insurance bill should help to remedy this side of the situation.

"Of course, to obtain full results the mothers of America should understand that under no eircumstances should money be sent to their boys, who are never in real need of it. In view of the present attitude and expressions of the French government, the mothers of America may send their boys to France with the assurance that good care will be taken of them. Never at any time in the military history of the world have such ef forts been made toward the welfare of a

VIRGIL V. TOHNSON.

Representing the War Department Commission on Training Camp Activities, in Community Organization.] Kalamazoo, Mich.

#### A CORRECTION

To THE EDITOR: May I call your attention to an error in your column of personals in the issue of October 20 under the name of Mrs. Edith Shatto King, new manager of the National Social Workers' Exchange, 130 East 22 street, New York city, of which your note speaks as follows: "The exchange, it will be remembered, was organized last summer to take over the Social Work Department of the Intercollegiate Bureau of Occupations."

May I, as president of the exchange and as a member of the board of directors of the intercollegiate bureau, make clear the fact that the exchange has not taken over the Social Work Department of the intercollegiate bureau, but that the exchange is an

entirely new organization. While it is true that some of the persons

who have organized the exchange have been related to the Department for Social Workers of the Intercollegiate Bureau of Occupations, the two organizations are entirely separate and distinct, and the exchange is Workers of the bureau.

May I take this occasion also to point out that the intercollegiate bureau, in addition to its well-known work in placing women in other vocations, continues to register women social workers for positions in the city of New York and vicinity. The Social Work-ers' Exchange is a national organization, supplying social work positions with both men and women throughout the nation, including New York city.

New York. RICHARD H. EDWARDS.

# SOCIAL PROBLEMS IN TIME OF

To THE EDITOR: It has been found that it is common for the class of persons who are known as "radical" to be pretty "conservatively" denunciatory of such as may be called "conservative" towards social problems. It is well to soften the asperities of these good reformers when they see a certain falling off in the zeal of former associates today, concerning domestic problems, by going back to our basic "point of view." It is comparatively easy to accept with respect and patience individual differences in theory. Thence it is possible to see how logically individual differences in theory. an attitude is reached, very different from that of the "radicals," in regard to these very "social problems."

Now it is the case that a certain number of individuals, who had labored in cooperation with the great army of social reformers, became convinced in August, 1914, and have been led to an ever-deepening conviction, of the truth of that which the sturdy reformer, Louis F. Post, summed up (in the advanced organ of opinion, the Public) as the Hohencollern's "stupendous attempt to realize in part his long-fostered policy of world con-quest." Furthermore, and foreing woon the United States, for mere self-protection, the entrance into the war against aggressive imperialism, "pursuant to that policy and for its more complete realization, he has thrown his western battle-line beyond Belgium, bevond France, beyond Great Britain, many leagues out upon the Atlantic Ocean toward United States."

Claiming respect for this point of view, not only taken by the great body of Americans, but declared by its official voice, what follows logically?

This force must be subdued by force, since there is no safety for the world except by its destruction and the unconditional sur-render of the central powers. No other means to attain its absolute destruction are imaginable. That is, the war must be won by one of the victories which insure per-manent peace like those which caused the unconditional surrender of Yorktown and Richmond. The United States is to be a great factor in winning such a victory. If the war should be lost, the whole prog-

ress of the world would be stayed and even a tremendous set-back involved. The work of Sisyphus would be our appalling prospect.

Every democratic movement, every social, moral and political cause whatever should be side-tracked or modified if their promotion interferes in the slightest degree directly or indirectly-with the great oppor-tunity for service in "winning the war," and and the passionate zeal needed to support it; now that the "fiery cross" has gone through the land!

Many reforms, of eourse, not technically aids to war, promoted in your columns, are not only such in effect, but, as leading to permanent economy, energy and efficiency, will palliate some of war's intrinsic horrors and illustrate the presence of the great over-ruling Power which "shapes our ends" for good, though we are cruelly driven to "rough house" them.

The world is in flames; a nation to aid in its salvation must perhaps "go mad," France. Call those preachers of "sanity" if you will who would divert interest to lesser things; in such a case, "sanity" is horribly insane!

Boston. ERVING WINSLOW.

#### SURVEY'S DIRECTORY OF SOCIAL AGENCIES THE

SHEVEY

CLATES

#### KEY

If you know the name of the agency If you know the name of the agency or organization, turn direct to the list-ings (3d column) for address, corre-sponding officer, etc. [They are ar-ranged alphabetically.]

If you seek an unknown source of information, turn to the subject index, following. The initialings correspond to capital letters in names of agencies.

If you want to know the agencies at work in any great field of social concern, turn also to this index. [They are grouped under major subject clas-sifications, as "HEALTH," printed in capitals.1

Correspondence is invited by the agencies listed; questions answered (enclose postage for reply) and pamphlets supplied free or at nominal charges. Membership is not required of those seeking information, but offers an opportunity for you to share spiritedly and seriously in your com-munity or profession in an organized movement which is grappling with some country-wide need or cause.

If you are uncertain where to turn, address the SURVEY, and we shall en-deavor to get your inquiry into the

#### WARTIME SERVICE

"HOW the Survey can serve"

Note the subject of an informal conference held early in April, in our library, to which we asked the executives of perhaps twenty national social service organization. The conference was a unit in feeling that as a link between organized efforts, as a means for letting people throughout the country know promptly of needs and national programs—how, when and where they can count locally—the SURVEY was at the threshold of an opportunity for service such as has seldom come to an educational enterprise.

The development of this directory is The development of this directory is one of several steps in carrying out this commission. The excutives of these organizations will answer questions or offer counsel to individuals and local organizations in adjusting their work to emergent wartime demands.

Listings \$3 a month for card of five lines (in-cluding one listing in SUBJECT INDEX by full name and three by Initials), fifty cents a month for each additional line. No contracts for less than three months. Additional charge of \$1 for each change of copy during three-month period.

# The Relief of Halifax

HANK YOU. Send one million units pneu-moniac serum." This message, flashed over the telegraph wires Sunday evening from the stricken city of Halifax, tells with dramatic brevity the story of the added misery that faced the inhabitants of that town and the neighboring village of Dartmouth, when the horror of a driving blizzard was superimposed upon the explosion of a munitions ship and fire that had already killed thousands of people and wrecked thousands of homes. With no protection from the snow but houses with windows blown out, plaster down, chimneys gone and walls and roofs rent, the people of Halifax felt a new menace, less spectacular in its coming and slower in its inroad upon life and health, but none the less certain and harder to be met adequately. Food and clothing are quickly thought of when disaster overtakes a community, and generosity promptly transports these to the place where they are needed. But the less obvious resources of medical science are apt to be lost sight of. Even here, however, organization has made great strides in the past ten years and the necessaries of medical comfort are usually found on the first trains that enter a devastated area. Pneumonia, however, has not been regarded as a usual concomitant of disasters and therefore has not been planned for on a large scale and in advance.

When newspapers announced last Saturday morning that a bilizard was halting rescue work in the shock and fire-ravaged city, the Department of Civilian Relief of the American Red Cross had already dispatched a number of car loads of supplies and a strong group of skilled relief agents to assist in this work. To W. Frank Persons, director-general of civilian relief, the coming of the blizzard meant one thing—death from exposure and from the slower processes of pneumonia. He therefore telegraphed to the authorities at Halifax with whom he had been in touch, asking whether anti-pneumonia serum was needed. Not until 8 o'clock Sunday night did the answer, quoted above, reach him.

Within fifteen minutes Ethan Allen, manager of the Atlantic division of the Red Cross in New York city, had been reached by telephone at his home and advised of the request. The names of the half dozen places in the United States where anti-pneumonia serum is made were given to him. Several of these are in New York city, one in Philadelphia. With Mr. Allen at his home, was John Magee, director of military relief for the Atlantic division, and to him Mr. Allen turned over the securing of the serum.

When the request for a million units was made to the places where it is manufactured, only amazement was forth-coming. Anti-pneumonia serum is a comparatively new product of preventive medicine. It is not spoken of by the profession in terms of units, as is anti-diphteria serum; moreover, a million units was declared to be an unheard of amount. Three of the four places communicated with—the Rockefeller Institute, the New York city Department of Health and the Lederle Laboratories—had only enough for a few patients and to send this to Halifax would be to deprive persons equally in need nearer home.

A fourth place, the H. K. Mulford Company, manufacturing chemists of Philadelphia, held out a slightly brighter hope, however. By noon, Monday, word had come from the plant of this concern that 850 ampuls of their anti-pneumo-coccic serum, or enough for several hundred patients, was available and could be shipped that day. This quantity, therefore, was immediately purchased and by Monday evening was part of a train load of other supplies that had left New York city, under the direction of the Atlantic division of the Red Cross, for Halliax.

The sending of this serum was only one of the dramatic and unusual incidents that occurred in the early days of meeting what has proved to be the greatest disaster that ever befell a Canadian city, and one of the greatest disaster that ever happened in the western hemisphere. The prompt act of the Public Safety Committee of Massachusetts in sending not only a large quantity of glass and putty for broken windows but also temetry-five killed glaziers to put it in, was another. The sending by the American Red Cross of a complete X-ray outfit and an operator accompanying it was a third. In spite of the isolation of Halifax for several hours following the explosion and the fact that, as usual in large disasters, reliable details of the damage were lacking. the imagination of two countries seemed to leap to the event and people everywhere were found thinking concretely of the specific needs to be met.

Help came quickest, of course, from places near by. Maine, separated from Nova Scotia by New Brunswick and the Bay of Fundy, was in a particularly strategic position. The governor, Carl E. Milliken, sent on Friday 2,000 blankets and 1,000 other blankets from Bangor, all consigned to the Red Cross at Halifax. A few hours later he offered to the Red Cross 400,000 square feet of beaver board, ten tons of putty, 200,000 pieces of window glass and 10,000 rolls of tarred paper and

100fing paper. These were accepted, forwarded on Saturday and used for temporary repairs of dwellings, windows and

Massachusetts, 450 miles away by water, was equally prompt. At 9 o'clock Thursday night, the day of the exposion, a special train of the Massachusetts Public Safety Committee left Böston with 1,100 pairs of pajamas, 350 luspital shirts and a large quantity of medical supplies. Friday night a special Red Cross train left the same city carrying twenty-five doctors, including two obstetricians, sixty-eight unurses and eight orderlies. A third train left Providence Saturday morning with sixty-two surgeons, sixty nurses, ten orthopedic surgeons and two hospital social workers. The doctors and nurses from Providence were part of the personnel of the Red Cross Naval Base Hospital organized in that city.

These are only a few of the first measures of assistance. From other American cities, from Now Scotia, from New Brunswick and Canadian points farther away, similar help was offered or sent. The population of Halifax itself, recovering quickly from the stun of the explosion, organized itself for relief. Mayor P. F. Martin, of Halifax, and E. F. Williams, of Dartmouth, aided by leading citizens, formed temporary relief and reconstruction committees, so that by the time help began to arrive from the outside the work of rescue was already under way and there were organized bodies with which to cooperate.

The American Red Cross was able to send to Halifax a particularly strong administrative committee. This committee is now in charge of all the relief and reconstruction work to be done by the Red Cross. Its services were accepted by the citizens' relief committee of Halifax. The chairman is John F. Moors, president of the Associated Charities of Boston, the institutional member of the Red Cross for New England, Mr. Moors is also identified with the Boston Metropolitan Chapter of the Red Cross and chairman of its emergency relief committee. He was in charge of Red Cross relief following the Salem and Chelsea fires. The secretary of the committee is C. C. Carstens, secretary of the Massachusetts Society for the Prevention of Cruelty to Children. Other members are: William H. Pear, general agent of the Boston Provident Association; J. Prentice Murphy, general secretary of the Boston Children's Aid Society; Miss Rowe, of the Boston Associated Charities; Katherine McMahon, associate director of civilian relief for the New England division of the Red Cross, and Janet Thornton and Miss Emerson, of the social service department of the Massachusetts General Hospital.

With this committee have gone several other persons experienced in disaster relief, five or six hospital social service workers and seven highly experienced office secretaries. Together, these constitute a group of well-equipped and experienced heads for the operating units of the Red Cross work and a nucleus of competent office help.

Mr. Moors and his immediate staff left Boston Thursday night on the special train of the Massachusetts Public Safety Committee. They reached Halifax Saturday morning and immediately got into touch with the appropriate authorities. Perhaps no better idea of the conditions found upon their arrivals can be given than by quoting the telegram sent by Mr. Moors to Mr. Persons Saturday morning:

We arrived this morning and have been in touch today with Premier Borden, Governor Grant, Mayor Martin, Justice Harris and many public-spritted citizens. They are deeply moved by the generosity of the American people. A promising relief committee with appropriate sub-committees is now being organized. The people here seemed pleased by hus getting started toward the control of the problem. The number of dead and severely wounded is not yet known definitely. It has been determined after consultation that I should suggest that immediate medical and other needs are now well supplied by your generoisty and otherwise that further commitments of relief supplies, doctors and nurses should await specific requests from here. You may safely send window glass.

A special Red Cross train left Boston Friday morning containing full equipment for a five-hundred bed hospital. This equipment was that of the Base Hospital No. 5, organized in Boston by the American Red Cross. Everything for this hospital except iron beds was sent, including mattresses, blankets and sheets, pillows, pillow cases and a full supply of surgical dressings and bandages, surgical instruments, etc. The five cars of this train contained also thirty-one cases of sterilized dressings, 1,000 bed comforters, 50,000 serilized compresses and sponges, 2,500 gauze bandages, 3,000 convalescent gowns and robes, 1,000 pajamas, 1,200 surgical bed shirts, 1,200 sweaters, 1,100 mufflers, 1,000 pairs of socks. 500 wristlets, 628 trench caps, 830 belinets, one bale of absorbent cotton and one case assorted bandages.

As early as I o'clock Friday aftermoun a special Ret Crostrain flying the Red Cross flag and marked Relief for Halifax left New York city. Captain Boyd, of the United States army, was in charge for the Red Cross, accompanied by Mr. Russer, of the Atlantic division of the Red Cross, who has charge of the Red Cross warehouse for supplies in New York. The train carried 500 cost, 5,000 seds, 3,000 bed socks, 10,000 sweaters, 100 cases of clothing for infants, children, men and women, underwear and outer-garments, 10,000 blankets, twenty cases of disinfectants, twenty cases of bandages, sixty cases of surgical supplies and a carload of foodstuffs, carrielly selected.

On Saturday the Secretary of the Navy, by telephone offered to the Red Cross 10,000 blankets then at the Portsmouth (N. H.) Navy Yard, and 20,000 blankets which he said, could be spared from the New York Navy Yard. The Red Cross, while greatly appreciating this generous and considerate offer, had not found it necessary by Monday to ask for blankets because 50,000 had already been sent by it. So tar as the stowes are concerned, decision will be reached on advice from Mr. Moors. It seems, however, obvious that new stowes will not be required until new houses are erected, and that this shipment should not be made in a way to interiere with the more rapid movement of lumber, glass and clothing.

Over the week-end two carloads of additional clothing was collected at New York city, all newly purchased and consisting principally of shoes, stockings, boots, rubbers and under wear. These are mainly for women and children. The shipment included also 800 overcoats. This all left New York Monday evening, carrying also the anti-pneumococcic serum mentioned at the outset.

The Red Cross learned on Sunday that five carloads of glass were packed and ready for shipment in Maine—two at Bangor, two at Augusta and one at Gardiner. These had not been moved, owing to congestion of traffic. By calling this condition to the attention of railroad officials in Washington, Mr. Persons secured the immediate movement of this glass. In the event that the glass is not unherwise contributed, it is probable that the New York city Mayor's Committee on National Defense will desire to contribute the cost of one carload of this shipment. In addition to those five carloads of window glass, 1,496 cases were shipped from Boston Sunday on the S. S. Calvin Austic, hartered by the Massachusetts

Public Safety Committee which contemplated sending 1,200 more cases on the S. S. Northland sailing from Boston on Tuesday. There is no present information which warrants additional shipments of window glass at this time. On the same steamer the American Red Cross is sending 25,000 blankets.

On Sunday the maxors of Halifax and Dartmouth issued an appeal to the people of Canada for \$25,000,000 for restoration of the means of self-support to destitute families and for reconstruction of dwellings. Following this the Red Cross announced that it would make no independent appeal for funds. The government of Canada made a preliminary appropriation of \$1,000,000 for immediate relief in Halifax.

On Monday the estimate of casualties made by John F. Moors, Red Cross representative in Halifax, was 2,000 or more dead, 3,000 severely wounded, besides these, 5,000 or more homeless. The estimate contained in the New York Fimes of Tuesday was: Known dead, 1,209; unaccounted for, 1,920; wounded, 6,000; homeless, 25,000. The prefatory

note to Mr. Deacon's article below shows that the Halifax disaster, compared with other disasters to single communities, is unparalleled in toll of human life, while in property loss and homelessness it is not remarkable.

These figures afford some basis for estimating the amount of material reconstruction that will be needed. They afford very little for estimating the amount of economic restoration that will be required to put the stricken families back upon their feet. Many of those killed are children, but many too are breadwinners. In this country, notably in the Triangle Shirt Waist fire in New York city, genuine efforts have been made following a number of disasters to restore families to a condition of independent and permanent self-support; lump sums have sometimes been paid them (in the Triangle fire \$4,000 and \$5,000 were paid to some families) and sometimes other nueans have been adopted. Whether Canada will see her task in this light is not certain now. If she does, the prospect is that she will need more money than she now realizes.

# When the City Burns

By J. Byron Deacon

AFTER the immediate and most pressing needs of Halifax, in the days just following her overwhelming distinct, have been met, and looking to the future of relief and rehabilitation in that
stricken city, the paragraphs here given may have a definite value. They are portions of a chapter on
Fires from the advance sheets of a book entitled Disasters, to be issued by the Russell Sage Foundation
on January 1. Several months ago, J. Byron Deacon, secretary of the Philadelphia Society, for Orgonizing Charity, and now serving, on leave of absence, as division director of Red Gross Gwilian Relief for Pennyshvania, began the preparation of this contpact and thoroughly readable little volume. It
will cover every type of disaster on this continent following which the American Red Gross has been
called upon for relief and service, such as disasters at yea, mine disasters, foods, fires and tornadoes.

How far experience in the United States is going to apply to the terrible plight of Hallfax, her citizens and those of the rest of Canada must be the judges. In some ways her situation is unparalleted. The chapter here quoted does not deal, though others will, with relief of survivors following upon heavy loss of human life. Property loss and homelessness, as it happens, have been the outstanding features of city-violed fires in this country. In Hallfax, both of these are merely added to the tragic toll of lives. The following figures, also supplied by Mr. Deacon, will make comparisons easy: Chicago fire, 300 lives lost, 100,000 persons homeless, 17,450 buildings destroyed, property lost, \$10,000 persons homeless, 28,168 buildings destroyed, property lost, \$17,000,000; Salem, Mass., 2 lives lost, 10,000 persons homeless, 1,792 buildings destroyed, property loss, \$17,000,000; Salem, Mass., 2 lives lost, 10,000 persons homeless, 1,792 buildings destroyed, property loss, \$14,000,000.

HE abrupt flight of men, women, and children from their dwellings and places of employment to refuges in parks and open spaces, their houses and furniture perforce left a prey to the flames, the separation of ramilies in the haste and confusion of the rout, the agony of fear and suspense until they are reunited, the utter dependence upon others for shelter, food, and clothing—this drama of the refugee is a characteristic which city-wide fires have in common. Fires such as these work sudden, violent, extensive, and prolonged interruption of the normal community life. They destroy vast stores of food and other necessities, disloct act transpuration, disorganize business, throw thousands out of employment, and create relief problems which the prostate community is mable to meet without outside assistance.

With scarcely less rapidity than the advance of the flames or the flight of the refugees comes the formation of relief forces, first within the ill-fated city itself and then, as the news of the calamity spreads and seizes on the imagination and sympathy of the public, in other cities and towns and states. Not a few impromptu local committees, each rallied around some forceful man or woman and each working independently of the others, enter the field and essay such relief activities as seem to them of most importance. No doubt in the very first days following disaster; these little bands render substantial help in meeting the great press of obvious and immediate needs, but their period of real usefulness is short-lived, and by continuing to maintain a separate existence after it has passed, as usually happens, they seriously hamper the execution of more comprehensive relief measures.

The imperative first step in the organization of the relief forces which must be taken by the fire-stricken community is the appointment of a provisional central relief committee. The membership of this committee should include citizens is such commanding prominence as to assure the entire consists of such commanding prominence as to assure the entire consists.

dence of the community. It is of primary importance that men and women of broad experience in philaultropic and civic work should have a place on it, since they more than any other group in the community know the helpful resources of the city and how to invoke then in behalf of those in distress. The prompt appointment of a central committee and the immediate announcement of its creation by official proclamation of the chief municipal officer, establishes confidence through the assurance it gives that relief plans are under way and in the hands of responsible persons. It also operates as a deterent of the tendency to multiply relief committees and provides an official medium for the collection and disbursement of relief funds and supplies.

The provisional nature of the committee should be clearly understood, since freedom to form a more permanent organization after the relief problems created by the calamity have been gauged and the persons most capable of forming and executing the policies of rehabilitation have been discovered, is an indispensable element of effective administration. Moreover, the way is left open to place on the permanent committee representatives of outside forces such as the commonwealth, committees appointed by other municipalities and trade bodies, officers and special agents of the American Red Cross, and individuals from other parts of the country who have had wide experience in disaster relief. The experience of San Francisco, Chelsea and Salem, Mass., bears uniform testimony to the fact that the individuals and agencies who join hands with the community from without have given aid in the formation of local policies and have brought vision and constructive ability to the work of relief and rehabilitation.

It is inadvisable to attempt at the outset an elaborate and detailed relief organization. In San Francisco, where this was done, the administration of relief was handicapped and retarded. The completion of organization should await determination of the extent and nature of the problems to be solved and the forces which can be applied to their solution. This does not mean that the central committee should not act with the utmost promptitude and decision—for prompt and decisive action is the key to the control of the situation. It does mean, however, that the committee should, at the beginning of relief operations, confine itself to the execution of tasks of immediate importance.

Among the first duties of the committee are to see that the military are called out, to keep order, and to be responsible for feeding and sheltering refugees. In San Francisco the United States army, and in Chelsea and Salem the National Guard, rendered extensive and efficient service. While the United States army and the state militia are not relief agencies, they nevertheless possess discipline and organization and command of supplies which enable them to feed and shelter large bodies of refugees more promptly and adequately than could be done if the task depended upon the formation of a special relief body. The city should be placed under martial law. The military officer in command should be made a member of the central committee and power to seize needed supplies should be vested in the committee; saloons should be closed, the sale of liquor strictly prohibited, and looting severely penalized.

Food and shelter are the necessities which must first be provided. Many of the fugitives will find temporary shelter for themselves with relatives or friends, or will be taken into the homes of strangers. In Chelsen, the night after the fire, relief workers were struck with the sudden disappearance of a large proportion of the refugees, and in San Francisco

there was an immediate and extensive exodus of refugees to suburban points. But large numbers, and where the stricken city is inaccessible to other communities the vast majority, will depend upon the relief forces for the provision of food and shelter. Many of the fugitives will take refuge in churches, schools, and other public buildings, as well as in parks, public squares, and vacant lots. These people must be marshalled and colonized in refugee camps, at first in tents and later in frame barracks or inexpensive small cottages. Administration of these camps should be delegated to the military.

Wholesale feeding of the refugees will be at first inevitable, and it, too, should be undertaken under the direction of the military. If the food supplies given prove inadequate, supplies should be confiscated. It may also be necessary to commandeer trucks for their carriage. None so well as the anny can handle at the outset the tremendous task of organizing the unloading, storing, local transportation, and distribution of relief supplies, but later the work can be continued by civilians as one of the administrative branches of the central committee.

Moreover at the earliest possible moment, as has already been noted, wholesale distribution of food from relief stations should be supplanted by orders for groceries, as well as clothing and other necessaries, on the relief stores, and as soon as possible on local merchants. In San Francisco a food card was issued to each family. The card bore the name of the authorized recipient, the name of the station at which it was to be presented, and the date of issue and expiration. Each card was good for ten days, and when rations were drawn, the margin of the card which bore the numerals from 1 to 31 was punched to indicate the date. One or more social workers should be assigned to each relief station for the purpose of interviewing and advising all applicants and recording essential information regarding them. Through these means food distribution can be systematized, supplies conserved, repeaters eliminated, rations adjusted to the size of families and to special dietary requirements, food charged for or discontinued when families recover a measure of independence, and the ground prepared for the more careful consideration and individualized treatment of need which characterize the rehabilitation period.

The distribution of clothing, blankets, bedding, cooking utensils, etc., has been at the outset, like the distribution of food, wholesale and indiscriminate. Within a very short time, however, it should be possible to introduce a system of requisitions on the central relief warehouse.

Transportation is the fourth major task of emergency relief. It has been said already that a large number of refugees flee the city, even before the conflagration is over. There are many, however, who are held there by lack of means but who wish to go to relatives or friends elsewhere, or to communities where they believe opportunities of employment await them. A bureau of transportation should be created. for which an operating official of a railroad would perhaps make a satisfactory executive. There should be associated with him, however, a social worker, for the reason that the problem of transportation is one not merely of securing reduced rates and of seeing that people are assisted through the details of schedules, tickets, etc., but primarily of determining whether the welfare of the applicant will be advanced by sending him to the desired destination and of making sure that he will not there become a public charge.

Among the tasks of emergency relief, that of safeguarding health is of vast importance. Army medical officers and Red Cross nurses will provide adequate sanitary supervision and medical care in the official refugee camps. Special sanitary regulations should be prepared and extensively circulated. Civil health officers should be made responsible for the most intensive sanitary inspection and rigid enforcement of these regulations outside the camps. These measures bear such an intimate relation to the protection of health that a community cannot afford to leave the task in the hands of political job-holders. It is advisable for the central committee to detail to each relief station a physician or group of physicians whose services shall be available for medical examination and treatment of the sick. Nurses ought to be assigned to the districts, where they can render important service in the conservation of health by reporting all cases of suspected infectious disease and by interpreting the sanitary regulations.

The establishment of an employment bureau to facilitate the placement in other industries of those whose regular employment has been indefinitely suspended by the fire is a necessary part of relief administration. During the emergency period, it may be advisable for the executive committee to grant the employment bureau a sum to be disbursed as wages to those men and women for whom it seems wise to provide temporary work instead of relief. The work should be necessary and in the public interest, but of a kind that can not be undertaken under municipal auspices and is not properly a charge against a private corporation or individual. A danger to be guarded against is the tendency of such employment to delay the return of men to permanent jobs.

The period of emergency relief must be regarded as having terminated when temporary shelter has been provided for the homeless in army tent camps, barracks, and other available places, when the distribution of food and clothing has been extended to cover all current needs, health having been safeguarded meanwhile by rigid enforcement of sanitary regulations, inspection, prompt isolation of those suffering from infectious disease, and an impromptu medical and nursing organization, and when transportation to other communities has been arranged for those who appear likely to provide for themselves more quickly and completely by removal from the stricken community.

At this point, relief administration passes to the tasks of rehabilitation. There is alwayd danger that the emergency status may be continued longer than necessary and consequently that the starting or rehabilitation may be unduly delayed. Such delay involves extensive waste of funds, prolongs the discomforts and privations of refugees, and retards the return of the community to normal life. These grave evils can be avoided only by instituting early in the emergency period a study of the rehabilitation problem and the formulation of definite plans. It is especially important that the relief committee associate with it for this purpose representatives of the American Red Cross and others who have had experience in rehabilitation work in other large disasters.

The object of rehabilitation relief is to assist families on recover from the dislocation induced by disaster and to regain their accustomed social and economic status. Emergency aid takes into account only present needs, rehabilitation looks to future welfare and aims not to restore losses but to open opportunities. The relation of the recipient to the giver of emergency aid is one of passive acceptance, but in rehabilitation relief the relationship must be one of active and intelligent cooperation. Neither those who are incapable of self-help nor those who possess the resources or enterprise to recover from misfortune without assistance are proper candidates for rehabilitation relief.

The more lasting distress caused by city-wide fires arises

from the destruction of houses and household goods and the suspension of business, employment and wages. Therefore the tasks of rehabilitation lie in the direction of stimulating the return of workers to employment as rapidly as business recovery opens industrial opportunities (curtailing and discontinuing relief at the earliest practicable moment bears a vital relation to restoring normal business conditions); of assisting artisans and small proprietors to resume self-support, by grants and loans for tools or business equipment; and of promoting the rebuilding and refurnishing of homes.

Accurate information regarding the present and previous income of each family, its physical conditions, previous occupation, amount of losses, resources in savings, insurance, real property, ability and inclination of relatives to help, and its own plan for the future, is the essential basis for determining whether rehabilitation grants should be made and in what amount and for what purpose. If experienced social workers are in charge of district relief offices, much of this information can and should be recorded through interviews with members of families who apply at these stations during the emergency relief period. But interviews with members of families should be supplemented whenever possible through reference calls by social workers upon those who can throw further light upon the family situation-not because of mistrust of the family's own statement, but because experience has shown that full data from varied sources enhance the helpfulness of relief. San Francisco demonstrated that even in disasters affecting scores of thousands, it is possible to make investigations which will include at least one source of information besides the family itself and that the effectiveness of aid varies directly with the thoroughness of investigation.

The nature and extent of the rehabilitation problem can be gauged in part from the records made in the district stations during the emergency period. And since it is assumed that a persistent effort will be made to reduce the volume of applications at relief stations at the earliest possible moment, the inclusiveness of registration will be determined by the promptness with which it was instituted. But not all who will need rehabilitation assistance will have applied for emergency aid. It may therefore be necessary to adopt some means of reaching those in the refugee camps who have not been registered, to determine whether they are able, unassisted, to re-establish themselves. One way of accomplishing this would be to undertake a general census of unregistered refugees. It should be recognized, however, that this may result in artificially stimulating applications for relief.

When the size and nature of the reconstruction work and the sum available for this purpose have been determined, or at least approximated, the relief committee should prepare a rehabilitation budget, estimating the sum required for each branch of work, and on the basis of appropriations authorized by the executive committee, should adopt tentatively a schedule of grants to be made to refugees for housing, business, and other rehabilitation purposes. It should also determine which activities are of most vital importance in restoring families to normal channels of life, and press first for the accomplishment of these. While grants ought, so far as possible, to be adjusted to the requirements of individual families, for the purpose of starting them toward self-support by meeting just that part of the burden they are unable to carry alone, nevertheless tentative limitation of grants is warranted as an expedient for avoiding liberal aid for the early comers at the expense of later but equally needy applicants, wherever an unknown volume of later applications is anticipated or the ultimate size of the relief fund is uncertain. It is advisable to require each candidate for rehabilitation to form his own plans for the future and to indicate definitely what use he proposes to make of the grant in carrying out this plan. Naturally before making a grant, the relief committee will satisfied by an agent's investigation and its own deliberations that the plan is feasible. A follow-up study of the rehabilitation grants made after the San Francisco fire led to the conclusion that in many of the instances where recipients of grants had not succeeded in becoming self-supporting, the failure might have been averted had the grants been reinfurced by wise personal counsel and guidance for a few weeks or months.

A most urgent and costly phase of reconstruction is that of withdrawing the refugees from the official camps and other places of temporary shelter and re-establishing them in permanent dwellings. In San Francisco it was found that the refugee population fell into four classes, and that it was necessary to make different provision for the rehousing of each class. There were (1) those who had previously been self-sustaining and property owners; (2) those who, while not owning property, had been self-supporting and who possessed initiative; (3) the non-property owners who evinced little stability or enterprise or capability of making effective use of financial aid for the erection of a permanent home; (4) the chronic dependents.

The method employed in assisting the first class was by offering to pay those who were otherwise unable to rebuild 33 1-3 per cent of the cost of a dwelling, provided the grant did not exceed \$500 and the house was built on their own property within the burned district. The procedure was for the applicant to submit his plan for approval and if approved, upon completion of the house according to specifications, the money was paid over.

The second class was helped by what was known as "the grant and loan plan."

The housing committee, assuming that theirs was in the highest sense rehabilitation work, perfected a thorough system of investigaion of all applicants. It defined its purpose to be: families in need of proper shelter to obtain a home suitable to their wants and in proportion to their earnings." In placing the grants and loans, its theory was to give aid so as to stimulate the recipient to use it for the distinct benefit of his family. In a case where a family had heavy burdens and a limited income, money was granted outright. When there was reason to believe that a recipient could repay a part of the large amount needed, a grant was frequently supplemented by a loan. . In some cases the applicant deposited part of the cost of the house to be built, which was supple mented by a grant or loan. In other cases, the applicant being unable to make a deposit, the committee bore the entire first cost of the house. Many were aided who had no real estate before April, 1906, but purchased or leased a lot in order to build. The loans ranged from \$37 to \$595, as the committee found it wise to plan so that the amounts given or loaned should be such as would meet the actual needs revealed by a careful investigation. A reliable bank was enlisted to see that the loans were properly executed, mortgages recorded, and monthly instalments collected [San Franciscn Relief Survey, page 254. New York, Russell Sage Foundation Publication, Survey Associates, 1913.]

The grant and loan policy had the beneficial effect of stimulating a large number to purchase lots and erect homes of their own who otherwise would scarcely have been likely to do so.

Class 3, by far the greatest in numbers, was less capable of self-help than either of the preceding classes and was appropriately enough the first to receive housing help. Within eleven months of the fire, 19 tenements with a capacity of 650 persons, 4,000 three-room and 1,500 two-room cottages, had been built by the committee at a cost of approximately \$55

per room. A large number of the cottages had served for temporary shelter of the refugees, supplanting tents at the approach of the rainy season. Ultimately, over 5,000 of these cottages became permanent homes, for the most part, of class 3 families, under an agreement whereby the occupant was to pay for his cottage in monthly instalments of approximately six dollars for a three-room and four dollars for a two-room cottage. The amounts paid in instalments were later refunded to those who purchased lots to which they removed their little homes.

Naturally among the first to be differentiated from the general mass of retigees had been the homeless and friendless raged and infirm and other dependents of the fourth class. The city almshusse being overcrowded, when they were removed from the special tent colony where they were first sheltered they were placed in temporary barracks until finally transferred to a permanent home for the aged and infirm which was creted by the relief committee.

Manifestly it is neither necessary nor possible for the reliet committee to undertake business rehabilitatina among the class of large or prosperous moderate sized proprietors. It is to be presumed that these groups possess resources which will make self-recovery possible. In business rehabilitation the proper field of the committee is among those who previously had been self-employing in a small way of business as keepers of shops, stands, eating places, or lodging houses, as vendors, etc., who had sustained total or seriously crippling loss of equipment through the fire, and who had no other way of supporting their families. At San Francisco the rehabilitation committee formulated the following policy:

The committee is not disposed to set people up in business in which they have not previously been engaged, although it is possible some exceptions will have to be made.
 Estimates of amount necessary to start a business must be cut to

2. Estimates or amount necessary to start a business must be cut to the lowest practical figure.

3. References and other evidence should be required that applicant

is capable and that request is reasonable.

The general aim of (the) committee ... was to supply the right sort of man with money chought to pay one monils' sent, to buy the necessary fixtures, and to cover a deposit on stock or on machinery or instruments. The applicant ment into debt for the rest of his time to the stock of the stock of the stock of the stock of the the profits of the listeness. So he Transcess Relief's Survey, pages 173 and 173.]

The committee made over 1200 grants, ranging in amount from \$50 to \$500.

A bureau of special relief, which should be established before the emergency period is ended, has been found to be an indispensible part of organization for rehabilitation work. It is the function of this bureau to meet the many and otten urgeru teeds which fall outside the scope of housing and business rehabilitation. After the food distribution from district stations has been discontinued, the bureau of special relief assumes responsibility for providing material aid to those who continue to be in need. The relief is provided by issuing orders on local merchants.

Following city-wide fires, it is necessary to district the city for relief purposes. An office and a staff of social workermust be maintained in each district, under the executive direction of a supervisor and the general oversight of the commitee on relief and rehabilitation. In each district three should be a cunsultation committee composed preferably of those who, previous to the disaster, were active in the social work of the neighborhood. The function of these district advisory bodies is to consider unusual and difficult family problems and to make constructive suggestions respecting treatment.

# China's Social Challenge<sup>1</sup>

#### Social Institutions Old and III. New

By J. S. Burgess
SOCIAL SERVICE SECRETARY, THE Y. M. C. A. OF PEKING

RGANIZED social endeavor for the poor is no new fad in China. One who reads Chinese may find in the long encyclopedic series of books on the metropolitan province of Chihli, compiled by Li Hung Chang, two volumes on the History of Philanthropic Work and Famine Relief. This describes over 2,000 years of social work. The doctor's thesis of Y. Y. Tsu on The Spirit of Chinese Philanthropy, published in the Columbia University series, tells of a people who, in every generation, have given their money generously to relieve human suffering.

There have long been village cooperative societies to feed and clothe the poor. In many Chinese cities there are orphanages and poorhouses supported by local boards of trade, each merchant being assessed for their upkeep. The provincial governments have their institutions supported by taxes.

Yet in spite of a great volume of philanthropic work, the tact remains that poverty and distress in China are far more acute than in western nations in normal times. This is due both to the terrible economic pressure on the people and to the lack of knowledge of relief methods. While conditions in the lowest slums of our great industrial cities are, in some ways, more unsanitary and perhaps equally filthy, poverty and destitution in the Flowery Kingdom are far more general and more commonly seen.

It is impossible to go down the streets of the large cities without being accosted by repulsively filthy beggars, who sometimes display great sores and distorted limbs. Certain whole classes of working men are, moreover, in a state of practical industrial slavery. It has been estimated by one who knew China well that probably one-half of her population lacks adequate daily food. Four times in my six years of China, I saw men actually dying of hunger on the public streets of the capital. Even leaving out of consideration the vast areas of constantly occurring famine, conditions in other parts are far worse than in prosperous Peking. Edward A. Ross's chapter on The Struggle for Existence in his remarkable book. The Changing Chinese, has vividly depicted this terrible fight for existence on the part of millions of people.

In considering the organized agencies for relief in such a city as Peking, the investigator is confronted with two sets of institutions: those that represent age-long effort to help the poor, and those that directly or indirectly have been affected by the call of a new era.

In one government poorhouse of the former type, off a great court, were three low one-story buildings. In this were men and boys of the very poorest beggar type. They were practically prisoners, never being allowed to leave their stifling rooms for the street. Men and boys were herded together, lying on the "kang," or long bed, which is in reality a raised brick floor occupying two-thirds of the room. The keepers

CONVICT IN SHACKLES LOOKING THROUGH THE PEEP-HOLE IN THE DOOR OF AN OLD-FASHIONED CHINESE PRISON

were of the lowest type. Coffins, which in old China were objects honored and not to be avoided, were piled up in the courtvard ready for the next victim of disease and undernourishment.

One of the modern Chinese college boys who visited this institution with us said that he had no conception that any such places existed in China. The Chinese scholar and official knows no more how the other half lives than does the average man of similar classes in America.

In another institution of the old type were 400 men and women, divided, of course, in separate courts. The 200 men and boys were together in groups of 30 or more in large bare rooms. They were given no work to do and had no choice but to sit month in and month out on the long "kangs." Such conditions inevitably produce sodomy and vice. I was told. although I could not verify it, that the younger women were sold into lives of prostitution by the police guards who are in charge of the discipline of the institution. These inmates were from the beggar and dependent classes and had been herded in from the streets by the police. Undoubtedly some of these ancient institutions are better run, but we did not find any such in Peking.

A striking contrast to these old poorhouses is the Private and Public Industrial Poorhouse for Boys, situated in the west Tartar city in Peking. It is financed partly by government funds and partly by the contributions of merchants, 1 have often rambled through its spacious wooded grounds and walked across its large, well-equipped athletic field, through its well-lighted and airy schoolrooms and its industrial shops.

CHINESE POORHOUSE

Dependents and beggars who are herded in off the streets
by the police are kept here practically as prisoners. They
have poor food and no work to do

Five hundred books a day are drawn out from the total of only 5,000 volumes on the shelves of this, the only public library in the city of Peking

PRISON INTERIOR

About seventy men are crowded into this one room. The only movement allowed them is to go out into an adjoining court-yard about the size of the room

The superintendent of this institution was trained in Japan, where he learned the minute details of administration and discipline so scrupulously followed in public institutions in that oriental Germany. Its carefully detailed regulations, which I have before me, show that three kinds of boys are admitted: poor boys, 8 to 15 years old; blind and crippled boys; diseased boys. The lessons are of two kinds: 1. General education, including language and literature; ethics, including filial piety, faithfulness, modesty, loyalty to friends, and honor; simple mathematics; simple painting; drill and singing. 2. Industrial work.

The daily-schedule is carefully worked out, with exact hours for rising, meals and retiring. Arithmetic and pennan-ship are given one hour a day, military drill and singing take another hour, while industrial work occupies four and one-half to five hours daily. The trades taught, as I remember them, were hat-making, cloth-weaving, belt-making, timstithing, laundering, carpentry, printing and soap-making. There are carefully trained instructors and good equipment in each department.

In one corner of the large grounds is a modern infirmary where a physician, trained in western medicine, holds his daily clinic for those of the 400 boys who are in need of his services.

Adverse criticism of this great institution, now ten years old, is not on the efficiency of its practical management, but on its mechanical way of dealing with the boys. The manager is extremely concerned over the fact that he found it very hard to change the character and ideals of its students; he said that the beggar's inheritance is very difficult to eradicate. Some of his best students, when released, went back to the old way of living, neglecting the trades which had carefully been raught them.

In the same city is a small and far less pretentious institution, the Peking Orphanage, with 50 small boys and 50 girls. This is under the direction of a dozen young Chinese officials and business men, for the most part American college, graduates. V. K. W. Koo, the Chinese minister to the United States, was, up to the time he received his present appointment, president of the orphanage. This institution, in the perfection of its detailed administration, is equal to the one described above, and has also the great asset of the kindly and homelike atmosphere created by the matron, Mrs. Feng, a woman of noble Christian character, who has given her life to this great work without material compensation. She is the sister of the late General L. Chang, the leader of the popular anti-opium movement of China. General Chang was the moving spirit among the directors of the orphanage during his life. Not only is sewing and domestic science taught the girls, and weaving the boys, but the spirit of love and service characterizes all the relationships of this large family of one hundred children.

I have at present no way of knowing whether or not the ancient philanthropic movement dealt with the alleviation of the dense ignorance of the great mass of China's people as well as their physical needs. From olden days there has been a real democracy of elucation, running parallel to an aristocracy of learning. This paradox is understood when one realizes that anybody who had leisure to learn could take the examination for classical degrees and, if successful, might become an official of the highest rank. In spite of this democracy of origin, however, those of the scholar class, when once they have attained their place of prominence, constitute a real aristocracy.

In the Chinese mind, virtue and worth were very closely related to perfection of scholarship. Practical interest in the

THE PEKING ORPHANAGE-A MODEL INSTITUTION

Conducted by a group of young officials, most of whom are graduates of American universities. V. K. Wellington Koo, the Chinese minister to the United States, was president of the orphanage up to the time of his leaving China. Fifty boys and fifty gift, most of whome waver reseased from the Hankows fire during the first revolution, are trained in industrial classes and are given a good home. The matron of the orphanage, Mrs. Feng (at the left of the back row in the picture), is the sister of General L. Chang, the great anti-optim reformer.

intellectual welfare of the great mass of those who, for economic reasons, lacked time for an expensive education, was not a marked characteristic of the old China.

In the new China, however, there is a radical change of emphasis. The aim of the government is clearly towards universal education and extension of the already numerous modern primary schools, so that all the children of China shall have the chance to possess at least the elements of western knowledge.

The Chinese government has, of course, realized that this ideal cannot be immediately put into practice and that something must be done at once to reach the great mass of the totally uneducated citizens, who have not had the opportunity to study the new ways of western learning. To meet this emergency, some years ago in Peking, and in many other large cities, the board of education founded a series of free public Hsuan Chiang So, or lecture halls. In Peking there are eight. The lecturers are selected from those who have had at least a primary school education. They are put through a six months' course in the elements of western thought, studying such subjects as geography, the principles of democracy, public hygiene and modern history.

Some of these lecture halls are well equipped with maps,

globes, a small modern library, desks, benches, blackboards and small exhibitions. The lectures, however, are frequently of a very diluted and unserviceable character. I chanced into one of these halls on a Saturday afternoon and took my place among the large group of jinrikisha coolies, peddlers and street loafers. The subject of the address was ancient events in the reign of an emperor who lived 3,000 years ago. The thin veneer of western learning was soon forgotten by the old-style scholar when he began his public discourse.

These halls, however, might be used to great advantage by trained groups of intelligent citizens including college students. Moreover, the thousands of school buildings throughout China, now used only in the mornings and early afternoons, are as capable of being made into community centers as are the schoolhouses of America. In fact, the pressing needs of the vastly ignorant populace of China constitute a challenge for this sort of work even greater than the similar challenge in the United States.

One need only walk through a Chinese public bazar and see hanging in rows the dried snake-skins that are to be ground up into powder and used for medicine, and inspect the needles of the old Chinese medical practitioners, to realize that there has been little of any "medical science" in China.

MODERN INDUSTRIAL HOME FOR BOYS

This government institution not only provides a good home, but teaches trades to four hundred dependent boys. The head of it was trained in the philanthropic institutions of Japan and all its teachers have had modern training. The sanitation and health are of the best. An athletic instructor has charge of the modern playgound shown in by feture

That by process of trial and error, however, some good remedies have been discovered and are being constantly applied, there can be no doubt.

The methods of public relief for the sick and mainted among the poor have been as haphazard as the medical practice. Only in recent years has there been any considerable organized effort by the government or by private citizens either to relieve those who were sick or to remove the causes of disease.

#### Medicine Old and New

Writ the coming of the new age in China a whole crop of new medical institutions has sprung up. In Peking there are many of them. The North City Government Hospital was founded in 1907. It employs, for its ward of twenty beds and its free dispensary, five doctors trained in western medicine, largely graduates of Japanese universities, and four experts in the old Chinese medical practice. Each patient may choose between western treatment and the old Chinese remedies. Our guide told us that out of every five hundred patients about one hundred would choose the old way, and that the proportion using the western medicine was gradually increasing.

It is to be confessed that the rusty surgical instruments in the operating room and the general deserted look of the institution made it hard for us to believe either in the efficiency of the doctors or in the story told us by the attendants of the five or six hundred patients coming each day for treatment. We were told that this institution cost three thousand dollars, Chinese currency, a month to run.

To a similar government hospital in the southern city of the capital there is attached a medical college which has twenty students. Of the seven professors, six received their training in Japan and one in Europe. There are also a number of small private dispensaries in Peking. Some years ago a group of old-school Chinese doctors clubbed together and founded what is known as the An Hui private dispensary (An Hui Sus Yuan). These doctors treat patients every morning, giving advice free, but selling the medicines prescribed.

A most interesting private medical college and dispensary, called the Chinese and Western Helpful Philanthropic Association (Chung Hsi Chiu Chi Tsu Shan Hui), was founded by four old-style Chinese doctors some eight years ago. In the day-time they treat patients in the public dispensary, and at night they lecture to fifty students who are attached to the institution. These students, who learn medicine by observation during the day and in the classes at night, pay two dollars, Chinese currency, per month. Each patient pays six coppers (about two American cents) for treatment. Some western medicines are used, but principally the old Chinese remedies.

This paper does not deal with the large amount of medical work in Peking already done with such efficiency by foreign missionaries and others. The Union Medical College, founded by the London Mission, and the French and German Hospitals have made a demonstration of what can be done by well-organized medical institutions. The founding of the Rockeeller Hospital in Peking will mean a new era in the work of missions and of foreigners generally in China and by its reflex influence in the native medical institutions. The Chinese, as we shall see in the case of prisons, when once they decide to adopt in a thorough-going way the western methods, will themselves found a thousand well-run institutions for every one which the foreigners start.

The changed social customs relating to women are among the most striking evidences of transition in China. During the years just after the revolution there were especial evidences of change. For the first time in history, women were seen addressing the people on the streets and in lecture halls. The famous Shanghai "dare-to-die" group of young women, banded together to do their part in over-throwing the hated Manchurule, women bounb-throwers and the leaders of the woman suffrage mowement were among the most ardent of the revolutionists. In the new education in China the little girls have their place in the primary grades, and many high schools for women have been established. In Peking there is a well-conducted normal high school for women and even a special women's law collects.

This rapid change of social status is not without its dangers. In the large cities thousands of young girls live—in-colege and school dormitories—away from home, a condition never before existing in China. A new world is opening out to them. A Peking Chinese daily newspaper, in an editorial on the dangers of the sudden change, told this story: An old scholar, dressed in the conventional flowing silk robes and wearing his large tortoise-shell glasses, was walking on top of the Peking city wall, a great mass of brick fifty feet high and fifty across. He chanced to meet a college student walking arm in arm with one of the modern young college women. The old scholar made straight for the couple and knocked the young man down. He then explained to the much disheveled youth and to the crowd that had gathered:

"I am taking this unusual method to protest against the breakdown of ancient and sacred customs which this couple, walking arm in arm in this public place, represent. In the old days, when men followed the teachings of the sages, such shamelessness as this—man and maid arm in arm in public would not have been tolerated for a minute. Right in this sort of action is the cause of the present terrible weakness of our land."

The transition from the iron hold of ancient customs to modern free relationships is fraught with remarkable opportunity for progress and with very evident dangers to social morality and the whole basis of family life.

There have perhaps been no more moral men and women in the world than the Chinese. As in other lands, however, the double standard held sway. Married women were protected on every hand. Loyalty to the marriage relationship was and still is universal on the woman's side, and is still perhaps superior on the husband's side to the prevailing standards of Europe and America. As in other oriental lands, however, the sugregated district is tolerated and, in the case of Japan and China, a licensed institution.

#### Freedom and License

Since the revolution the number of men who frequent the great red light district in Peking has, I am told by a high authority in the police department, increased by 100 per cent. The increase has come largely from among the official and student classes. The new freedom, as was the case in America and France after their revolutions, ushers in not only better and more progressive institutions, but a temporary era of license. The influence of western novels and example is no small factor in causing this increased evil, Moreover, the enthusiasm and energy generated by the new life of the republic has almost no wholesome recreational forms in which to express itself. The amusement centers of China's great cities are too frequently closely connected with and located in the red light districts. So far as I know, no careful study of this increasing problem of vice and of its relationship to lack of wholesome recreation has been made.

In Peking a hopeful feature in this situation is that the government itself has taken measures to relieve the worst conditions in the red-light district. The police department has founded a "door-of-hope" (Chi Liang So.), a well-run industrial home for girls. Any immate of a brothel who has been cruelly treated may apply to the police board to be admitted to this institution, and the police frequently rescue girls from the worst houses and put them here. "Unfortunately," the police official told me, "the place is too small. Instead of on hundred, we have need of a home for several hundred." A careful inspection of this place showed an apparently well run and clean industrial home. Weaving, sewing and other handiwork are taught.

On the street outside the Chi Liang So was a large board on which were the photographs of the older girls. Anyone who could prove his ability to support one of these girls, selected from the photographs, might take her as his wife or as secondary wife (legal concluine). While this latter aspect of the "door of hope" shows distinctly its limitations, still an institution which does no more than promote from prostitute to secondary wife is of real value. Furthermore, I was told that the young women are free to refuse the proffered hand of the suitor.

Our prison reformers in America think that they have found the worst conditions on the globe, but they would have been surprised a few months ago if they could have gone with the writer and a foreign friend to one of the prisons of China's capital. It was a rainy day, and our 'rikisha coolies pulled us slowly up Hatamen street and off into a narrow alley. We came presently to a great wooden gate and were challenged by two guards in blue uniform. We had our permits and were ushered in through two wide courts to the inner court, at the north end of which was a high stone platform with a large red table upon it. On the steps beneath the platform a large number of men, women and children were extend.

Here behind the table was the prefect's seat, and there justice or injustice had been dealt out to the citizens of the north district of Peking for generations. On one side of the table was a little vase, containing a few strips of wood, about six inches in length. These, we were told, were given to the famous yamen runners, when they were sent to fetch a prisoner, or to give an order from the judge. We passed behind the judgment seat and were met by no less a person than the district judge himself. He politely invited us to enter his private apartments and expressed great surprise that we had come in the rain, something which few Chinese gentlemen would have done. He was still further surprised when we unsisted upon seeing the prison adjoining the yamen, in spite of the rain,

#### Prisons for Punishment

AFTER going through several courts, we came to a great iron door. It was opened by the judge's servant. Inside was a long, narrow court, ten by twenty feet. We saw no one as we entered, but were nearly overcome by the odor. On the left side, on closer observation, we discovered a dirty little room with a black, smoking stove, which was the kitchen for the prisoners. Two cooks, bare to the waist and with their feet chained together, were preparing the evening meal. The next room, we were told, was used by a few of the prisoners, whose offences were of a lighter kind, for industrial work. Four rule-weaving machines were being slowly run by chained prisoners.

On the other side of the court was a building occupied by a

large number of men seated on the wooden floor. We were told that they were seventy in number, and that each one must serve a term of from three years to the life sentence. I have never seen human beings who looked less like men than did these. Their ditry faces were absolutely expressionless; their hair had not been cut for many months. They were bare to the wast, and some of them wure handcuffs as well as chains on their feet. I did not stay long in the thick air of this foul prison, but asked my questions after we were out of the court-way. If our visit did no other good, our remarks at least helped in getting a hair-cut for all these prisoners, for when a few days afterwards I asked Gilbert King, of the Methodist Mission, to take the photographs which illustrate this article, he found that every prisoner had a close-clipped head.

#### Prisons for Reformation

IF I had been a "globe trotter," the first thing to do after such a visit would have been to generalize on the terrible condition of all Chinese prisons and to argue from this the utter hopelessness of the entire Chinese race. But it is fortunate that no such conclusion was reached, for within a few days a very different sort of a prison was discovered.

Driving in a carriage to the other end of the city, down past the walls of the great Temple of Agriculture, one comes to a high white-washed wall surrounding an area of fifteen to twenty acres. On alighting from the carriage, one is welcomed by the polite prison guards. We were shown at once to the reception room of the chief warden, who was seated at a long table covered with an elaborate spread. Photographs of the prison were on the walls. The warden, after the few polite inquiries always customary in China, was willing to discuss the merits of the prison system of Europe or Japan with us.

At length we were ushered into the central prison rotunda, from which we could look down the five wings. Along the sides of these wings were the rows of cells. As we walked up and down, we saw outside each door neat little cards giving the name and the offence and the term of service of each occupant. We were told that the worst prisoners were put by themselves, and that the others were in rooms in groups of from two to seven prisoners. We went into several of the larger rooms. They were forty by thirty-five paces. Each cell was spotlessly clean and lighted by electricity. Each corridor had its own washroom, which was also a model of cleanliness. At the end of each of these long corridors are the larger rooms, where the industrial work was going on, Carpentry, weaving, iron and brass work, printing, lithography, bamboo and wicker work, tailoring, shoe-making and bookbinding were the trades taught. The rooms were well aired and well lighted.

We were next shown to the immense dining room, where a large proportion of the 500 prisoners could sit down to meals together. The warden went quite into detail about the menu, which was certainly most substantial and graded in amount according to the behavior of the prisoner. He next conducted us to the large bathroom, which each prisoner uses at least once a week; and to the dispensary, where we interviewed the Chinese doctor, trained in Japan, who reported intelligently on the health conditions of the prison.

We had not expected to find religious instruction as well as general education provided in a Chinese prison, but on the second story of the main building we were ushered into a large assembly room, with rows of seats elevated gradually to the rear after the fashion of a college chemistry lecture room. Each bench was surrounded on three sides by wooden partitions, so that the prisoner, when seated, could look only in one direction and that straight forward, over the head of the man in front of him.

On the wall which the prisoners faced were five paintings. The middle painting was of Confucius, in robes of blue. At his right were Buddha, in yellow, and Laotzu, in white. While at his left was Jesus, in a brown robe, and Mohammed, in green. The warden explained that these paintings had been made by one of the prisoners, at the warden's own request. Every Sunday there is a lecture on Confucianism lasting half an hour. Then the prisoners are left in silence. They are expected to gaze at the religious leader they may choose and to fix their thoughts on his teachings. The warden explained that he believed there is good in all religions and that each prisoner ought to get as much good as he can from the religious leader in whom he trusts.

On the same floor was a series of school rooms, where the usual subjects are taught to all inmates under eighteen years of age.

On our way out the warden showed us his system of registration. For each prisoner he had an index card, fingerprints, photograph, careful measurements of the head and various other minutine. As we went out of the last doorway, the warden said: "Just step into this room and I will show you the way China used to conduct her prisons." He produced three or four of the old, long execution knives and various instruments of torture reminiscent of the Spanish Inquisition. He spoke, of course, as if these were relics of the far past.

If we had been "globe trotters," now again would have been our time to generalize on the prisons of China, but unfortunately we had seen that other, old-style prison just three days before

Here, in the same city, we have two institutions, one of old China, similar to those which she has had for hundreds of years, and one which the late Charles R. Henderson, the great prison reformer, said was comparable to the best prisons of Europe. There seems to the Chinese mind little inconsistency in having these two so near together. In education, politics, religion and industry there are the same contrasts. But those who know the real China know that some day, not so far distant, the better types and those which are most profitable and beneficial to the Chinese people, will be the sole survivors.

The timely aid of a few well-trained American social workers may make this transformation more rapid and more

# Making the Bargain

Some Tendencies toward Collective Action in Non-Union Shops

By John A. Fitch

OF THE SURVEY STAFF

HIS stuff about the worker desiring to participate in management—it's all bunk and poppycock. He wants nothing so much as to be saved from responsibility. He hates responsibility. If he can get out of it, the average wage-earner won't even take a better job with more pay if it is going to upset his habits a little and make him think."

That is what a very successful manufacturer told me last summer. Of course it was collective bargaining that he was ralking about, although he insisted on calling it "participation in management." His point was that it is not only unnecessary but extremely foolish. Joint conferences with the employes to consider wages? Stuff and nonsense! The fixing of the wage is a problem of management. What has the wage-earner to do with that?

A few days afterward a man in the executive offices of a very large manufacturing corporation told me of a rather interesting incident. The men in one of the many departments of the huge factory drew up a petition asking for more pay. It had already been decided to raise their wages, but when the petition was presented to the superintendent he refused to receive it. He told the men that to circulate or receive petitions was contrary to the policy of the company, and that they would have to withdraw their names and come to him as individuals. Most of them, accordingly, withdrew their names. Some refused to do so and these were discharged.

The man who told me the story had nothing directly to do with the handling of men, but the situation interested him. How could the intrests of the company suffer by the circulation of petitions? He went to the general manager and asked him if such a procedure were really contrary to the policy of the company, and he was told that it was not!

This was obviously a factory in which there was no "participation in management." But it might be hard to show just how shop efficiency had been increased by this "kaiserization" of the plant. There was not even a well-understood policy unless it was the oft-quoted one of "putting the fear of God" into the working force.

Bargaining with the employes cannot be avoided. There is a contract, expressed or implied, between every employer and the men on his payroll, and the courts will enforce it. There must be, therefore, some sort of a meeting of minds, an agreement, or a bargain.

One method of making the bargain that is very common was described by the late Harrison G. Otto, owner of the Los Angeles Times, in testifying before the Industrial Relations Commission. "Free, independent, non-union, unfettered labor; asid General Otis, "is the true condition for the free-born, unenslaved American workman to live under. He has the right to be free under the constitution and the laws of his country—free to work where and when he will in his own trade or pursuit, when engaged to any employer of his choice, and at such wages as the two, standing face to face, may mu-

But in many cases the terms of the bargain between the employer and this free worker are arranged by one of the parties without consulting the other. It's small consolation to be "free" when that means that you have no voice in making your own contracts. The freedom under the constitution for the employes mentioned above to petition for redress of grievances was unquestionable. But they were not free to do it in the shop where they worked. They got a raise in wages by executive order, but not because they were free bargainers.

It's an old story-this of the shop where there is no talking back; where the bargain is not signed but posted on a bulletin board. Against such autocratic methods the unions have been fighting for years, in many cases with notable success. But now a new story is being written, and because it represents a change in thinking that is fundamental its importance greatly exceeds the tangible progress so far made. The new story is being written in those shops and factories where, however insignificant, there is a dawning recognition on the part of the management of the necessity of conference between the employer and the employes. In the last few years this idea has taken root in quarters where it could least have been anticipated, and it seems to be growing. Its expression ranges from occasional conferences for advisory purposes solely, where the situation is wholly controlled by the employer, to direct negotiation and bargaining, with power in the hands of the employes exceeding in many ways that of the workers in a union shop.

Richard A. Feiss, of the Clothcraft Shops in Cleveland—a remarkable shop in many ways—has always believed in individual bargaining, with final decisions made by the company officials. It is of more than ordinary significance, therefore, that within a year there has been organized in Mr. Feiss' factory an employes' "advisory council." Each division of the shop elects a representative to the council. Weekly meetings are held at which grievances or other matters of interest to the employes are discussed, and if any matter is considered of sufficient importance the opinion of the council is laid before the company officials. Thus the council "advises" the management, and the management then decides what to do.

This may not appear to be very different from the old method, after all. The testimony of a witness in one of the hearings before the United States Commission on Industrial Relations a few years ago seems in point. The witness was a most beligerent advocate of individual bargaining. The counsel for the commission asked how a man with a grievance could get a hearing, and the testimony ran as follows:

WITNESS: "He comes individually, he himself, or his associates; if there are a number of them they appoint a committee."

COUNSEL: "And when they appoint a committee, do you deal with the committee as such?"

WITNESS: Yes, we do."

COUNSEL: "When the committee brings a grievance up to you for adjustment who finally determines whether or not there is a grievance and what shall be done in the matter?"

WITNESS: "We discuss it, pro and con. If the men make out a fairly good case and have a real grievance, we try to redress it; we do redress it. If the men haven't a good case, we try to talk them off their feet; if they yield, as they do instead of striking, they go back to work. That is the end of it." COUNSEL: "Who decides as to whether they have a good case or whether they have no grievance at all?"

WITNESS: "Well, if we are sure they have not a good case, we decide it."

COUNSEL: "You decide it?"

WITNESS: "And we deny the application."

But there is, after all, an important difference between this sort of individual bargaining and the discussions between the management and the advisory council set up by Mr. Feiss. There is no collective bargaining at the Clothcraft Shops, it is true; and the advisory council is just what its name implies—decisions are made by the management. The important distinction lies in the fact that Mr. Feiss has recognized the necessity of getting advice from his employes as a whole. He could get it from individuals before. Now he has gone out of his way to encourage the formation of a representative body through whom the opinion of the whole body of employes can be transmitted to him.

#### House and Senate in a Factory

ANOTHER tendency in this direction is to be observed at the Prince-Biederman Company in Cleveland, manufacturers of cloaks and suits. Ther are a so-called House and Senate have been established. The rank and file of employes belong to the House. The Senate is made up of foremen. The whouses meet separately; bills have to be passed by both and then go up to the executive for approval or yeto.

This interesting device does not provide collective bargaining either. Some rather absurd claims have been made for it as a "democratic" organization. That, of course, is just what it is not. While the form of democracy may appear to exist on account of the analogy to the government of the United States, it should be noted that the Senate and the executive in this case both represent the employing interest. The Senate may deadlock the House, therefore, on any measure of real significance, but if it should be caught napping there is the executive veto—and there is no provision for passing a bill over the veto.

But this scheme, too, reflects the growing recognition of the justice of the employes having some voice concerning the conditions of their employment. There is perhaps better recognition of the same principle in the plant of the White Motor Company and the factories of the McIlwain Shoe Company. In both companies executive officers invite into the office, from time to time, different groups of employes for the discussion of the particular problems confronting them. In this way, a large proportion of the employes eventually come into direct contact with the responsible officers of the company.

The general manager of a large manufacturing company said to me recently: "Unquestionably there must be some machinery by means of which communication between the men and the boss may be facilitated. The question is, how are we going to get it? My idea is that the contact should be just as direct as possible. That's why I object to a union. It muddles the issue to deal with men not in our employ. I'll give you an example of how it can be done. We are working double shift, twelve hours on each shift. Some of the skilled men in one department wanted to change to three shifts. They notified the superintendent and he arranged to talk with them at the only time that it was possible for them to meet, Sunday morning. The superintendent told them he was willing to make the change but didn't know where he could find the extra men. He asked them if they did, and if so, would they get them. The men making the request hadn't thought of that. They considered it awhile and then agreed with the superintendent that it couldn't be done, at present. They told him that they would hold their proposal in abeyance pending a change in conditions.

"That's my idea," he concluded, "of the way things of that sort should be done. Through conference, the men were made to understand the question."

A considerable advance over these more or less vague beginnings is the plan in operation in the mines and plants of the Colorado Fuel and Iron Company. Here extensive machinery has been set up for negotiation between representatives of the employer and of the employes. The Rockefeller plan was described in detail in the SUREN of October 6. Its limtations were there pointed out. But it was also shown what a forward step the plan represents from the conditions prevailing before its institution.

#### Dickering Through an Employes' Council

A PLAN somewhat similar, but with machinery far less-elaborate, exists in a factory in the Middle West. An "employes' council," with one member for every fifty employes elected by popular vote, not only "advises" with the management, but bargains with them on all sorts of subjects, toucheding wages. Last winter, in a series of conferences, a new wage scale was agreed upon. The initiative was taken by the employes' council, which drew up a wage scale and submitted it to the firm. A passage in the letter from the executive committee of the firm acknowledging receipt of the proposed scale, indicates very clearly the triendly relationship that the plan seems to have developed between the employing interests and the employees. The passage reads!

The executive committee has received your communication of January 12, and, since that time, has spent many hours in content or over your wage recommendations appearing in that letter. The executive committee appreciates the opportunity of reviewing our recommendations, and also appreciates the conscientions effort made by the factory council in preparing these recommendations committee and the other employees of this factory cannot they to committee and the other employees of this factory cannot they unicrease the feeling of good will, which has always been so characteristic of this factory.

The executive committee welcomes the frank expression from the dother employee through their representatives on the factory council on any question involving this business. It will give any question submitted careful consideration and will reply to the employees and be equally as frank in rendering a decision, either for or against any recommendations made.

It is clear that these plans and methods of bargaining stop a long way short of treating the employe with full confidence. In every case the situation is really controlled by the employer. He is willing to accept advice from his employes; he is willing sometimes to go further and set up elaborate machinery through which the employes may register their opinion; he is even willing that negotiations should at times go far in the direction of collective bargaining, but usually he keeps the power of final decision in his own hands. In a situation where mutual confidence and good will is the thing most essential to satisfactory relationship, the attitude of the average employer, even the progressive ones whose methods have here been discussed, is usually one of distrust toward his own employes. Some power he can grant them, but not too much.

But there are employers who have confidence in the men and women on their payrolls. It may be that there are not many such; indeed the average employer can give you very convincing reasons why he should not have full confidence. But those employers who do believe in their employes enough to trust them with power, tell me that they have discovered a temarkable secret, which is, this: confidence breeds good faith.

There is a very interesting factory in Fort Wayne, Ind.

It isn't such a large factory, but there is a big idea under its roof. A. S. Bond, president of the Packard Piano Company, told me that about four years ago he had some labor trouble. Two hundred and sixty men were employed in the factory, and the difficulty grew eventually to a strike and lockout. After the trouble had been patched up, Mr. Bond realized that it would not have occurred if the men had had confidence in the management. He decided that in some way he had failed. The most important thing before him then was to win back the confidence of his men. Mr. Bond thought that in order to do this it would be necessary to call in the aid of some outsider, who did not have the handicap of having participated in a controversy with the men. An experienced industrial engineer was secured and the plan of having regular conferences with the whole working force was established. It was not difficult to meet two hundred and sixty men face to face.

For a while weekly meetings were held at which either the engineer or Mr. Bond spoke. The employes were encouraged to speak also, and to express their opinion. By this method a different spirit was slowly built up, and now whenever either side has any proposition to make to the other, a meeting is called and they talk it out.

At the beginning of the establishment of this method of dealing with the men, the factory was operated on the basis of the ten-hour day. Mr. Bond proposed to the men that hours be reduced to nine and that production be maintained at the old level. This was discussed and the men voted to give it a thirty-day trial. Being piece-workers, the matter was of importance from the standpoint of the pay envelope. At the end of thirty days they voted the plan a success. After this had been in effect a year, Mr. Bond proposed that they go to an eight-hour day or they sune basis. The men were somewhat skeptical about their ability to maintain full production on an eight-hour day. They voted to give this plan a sixty-instead of a thirty-day trial; again they succeeded, and the plant is now upon the eight-hour basis.

As time went on, various improvements were worked out; some by the management and some at the suggestion of the men. A plan for encouraging the men to work as economically as possible took the form of an offer to share with them any decrease in labor cost that might be effected. There is very careful cost accounting, and every month a dividend is every careful cost accounting, and every month a dividend is every careful cost accounting, and every month a dividend is every month of the previous year. This saving is divided equally between the men and the management. In two years, under this plan, hours have heen reduced from two hundred and sixty on one hundred and sixty, and the efficiency is so great—due to the shorter work day and the improved methods that the oroduction is the same as before

#### Where the Men Do the Firing

AT THE same time there has been a strong tendency toward contractic methods in the shop. The management, President Bond tells me, has now given up altogether the right to discharge men. Some time back, there were five men whose work was not up to standard and who, from various points of view, seemed to be undesirable employes. Instead of discharging them, a meeting of the employes was called and the president addressed them, stating that these men had not made good and asking for the advice of their fellow-employes as to what action should be taken. The matter was discussed for a time. One man seemed to express the opinion of the group when he told the president that while he agreed that the men

were not doing their work properly, he thought they ought to have another chance, and he moved that they be given two weeks in which to make good. This motion was adopted by unanimous vote. As a result, three of the men changed their tactics and became desirable employes and two quit voluntarily. Mr. Bond states that the right to discharge men has been permanently abandoned by the management. Any man, he declared, with whom the working force as a whole can stand it to work, the management ought to be able to tolerate.

The supreme example in this country of cooperation, good will and sharing of power is, and doubtless for a long time will continue to be, that of the store of the William Filene's Sons Company, in Boston. Here the right of discharge has not been given up, but an arbitration committee composed exclusively of the store have the right of review. Beside that the employes of the store have the right, by a two-thirds vote, to overrule any order, rule or decision that may have been issued by the management.

The organization through which the employes act is the Filene Cooperative Association, popularly known as the "F. C. A." Every employe becomes a member automatically as soon as he enters the employ of the store, and as such he immediately acquires a voice in its affairs equal to that of any other person in the store. The newest cash girl is a member and so is the president of the company. Each has one vote

To gauge its significance you need to understand the extent of the activities and powers of this organization. The executive body is the F. C. A. council, composed of twenty-three members elected by the membership—that is, by the employes. There are the customary officers and a salaried executive secretary. Under this organization social, athletic and educational activities of various sorts are carried on. There is a lunch room where meals are served at cost, and through the agency of the F. C. A. there is cooperative buying of all sorts of articles from coal to groceries.

The function of greatest interest and significance is, of course, the exercise of power over wages, hours and store rules generally. Any rule affecting discipline or working conditions can be amended or changed in any way by a two-thirds vote of the employees of the store in mass mereting. By a similar vote a new rule can be made. In either case the decision goes into effect a once. Similar action can be taken by a five-sixths vote of the F, C, A. council, and the rule thus adopted will go into effect at the end of the week, unless vetoed by one of the highest executive officers in the store or by a majority vote of the F, C, A. A veto by the management can be set aside by a two-thirds vote of the entire association in mass meeting.

There is an arbitration board composed of twelve members, who are elected by the F. C. A. in mass meeting, and a chairman who is appointed by the president of the F. C. A. This board, composed exclusively of employes, has full power of review over all cases of discipline in the store. It is not composed of superintendents or heads of departments. The last election resulted in a board the majority of which is composed of subordinate employes, such as salespeople and workers in the renair and service departments.

#### Powers Granted by the Directors

THE questions brought before the arbitration board relate generally to dismissals, changes in position or in wages, store rules, losses or breakages and differences between employes. In case of dismissal or change in pay a two-thirds majority of the board is necessary for a decision. In all other cases a majority vote is sufficient.

The support given by the directors to this plan and to the powers involved in it is clearly shown by a statement issued by the board. It expressed its approval of the following purposes of the Films Conservative Association.

- of the Filene Cooperative Association:

  1. To prevent the enforcement by the management of unjust rules affecting the discipline and working conditions of employes.
- 2. To prevent unjust discharges or removals of employes.
- 3. To inaugurate, when needed, new rules affecting the discipline, work or conditions of work of employes.
- To conduct the social and so-called welfare activities of the store without the dictation, but with the cooperation, of the management.
- 5. In general, to enable all of the employes of the corporation to have a sufficient voice in the store government and administration to make it just, considerate and effective, and to develop a healthy atmosphere of real service to customers and to each other.

There is further power in the hands of the workers through membership in the board of directors. Out of eleven members of the board of directors four are representatives of the employes. Each year the F. C. A. council nominates six candidates for membership in the directorate. Of these, four are elected by the seven capitalist directors, and they serve for a term of one year.

#### Filene Employes in Action

To MANY employers the placing of so much power in the hands of the employes would seem little short of madness. How long will it take, they might ask, to wreck a business conducted that way? Well, the Filene Cooperative Association with most of its present power lass been in existence since 1901, and since that time the business and the financial success of the store have constantly increased. In 1912, having outgrown its old quarters, a new eight-story building was erected and occupied.

When the details of this plan first came to my attention the thing that impressed me most was the arbitration board with final authority, on which was neither a representative of the management nor a neutral umpire. In controversies between the employes and the employers, the employes were to have the final and deciding voice. I was curious to know how the arbitration board discharged this responsibility.

The records of the board for a period of two years were placed at my disposal. I went over them carefully, paying especial attention to cases of appeal against dismissal. Here, it anywhere, it seemed to me, there would be opportunity for decisions made without regard to the interests of the store. I found thirty-nine such cases; twenty-seven of them were decided in favor of the store. Only twelve discharged employes were ordered reinstated. When I read the proceedings in each case, I was struck with the conscientious and scrupulous effort to be fair to the store. A number of cases which, on the face of the records, seemed to me to be unfair to the discharged employe, were decided in favor of the management. Only where the employe's case was unusually strong was a reinstatement ordered.

There is apparent, on the face of things, one drawback about the Filene plan, and that goes to the very heart of it. Power has been voluntarily given up by the management. It may then, at any time, be re-assumed. In general, it is only where the employes are so organized as not only to get power but to keep it that their interests are really safe. Collective bargaining needs to be on a firmer basis than the employer's good will. But that's another story.

# Four Months in France

## An Interpretation of the American Red Cross IV. The Sinews of War Relief

# By Paul U. Kellogg

Paris, October 15.

HERE remain those important administrative bureaus of the American Red Cross which make possible the whole system of military and civilian activities. In so far as they are the application of modern American business methods by a staff of specialists to the work in hand, they need no description,

In addition to its heavy routine transactions, the Bureau of Finance and Accounts has investigated numerous American societies in France, to determine their financial conditions and requirements, especially as affected by the commission of the Red Cross and by the raising of its great fund in America. The bureau will make regularly such examinations of all societies to which the Red Cross donates funds. The general requirements of organizations to which aid is granted are that their work must be on behalf of victims of the war and of a character appropriate to the purposes of the Red Cross; that they shall have responsible officers; that all funds shall be paid into the treasury and the treasurer shall pay out money according to a system approved by the governing board and requiring the approval of at least one other officer of the society; that proper books of accounts shall be kept; that duplication or overlapping of the work of other organizations be avoided; that records be maintained to show the character and amount of work done and dated case records be kept of individuals helped; and that the Red Cross shall be entitled at all times to examine and inspect the work, records and accounts

The Women's War Relief Corps, in line with its purpose to coordinate the activities of American women in France. maintains a registry for women workers and club rooms for employes and nurses on leave in Paris, makes Christmas kits for soldiers in the American army and generally cooperates with all the departments and hureaus of the American Red

The Bureau of Permits and Passes is manipulator of a never-ending process in which passports, identification cards, passes, photographs, must be shuttled through those intricacies which enmesh the war zone so that the staff may have free play in its work.

But perhaps the greatest poser of all fell to the office of the secretary general in installing a force of 300 people in 86 rooms, in the donated building overlooking the Place de la Concorde in the center of Paris, where the Red Cross has its headquarters. Your modern executive, without his flattop desks, push buttons and letter files, his stenographer and English-speaking telephone girl and all the impedimenta of business at its smoothest, is as out of his element as if walking abroad in his stocking feet. And here was a high-ceilinged club building (once a palace), with its crystal chandeliers and red carpets, its multiplicity of dining rooms and its lack of corridors, its abundance of everything but business conveniences; and here was Paris, short of office furnishings because of war and stripped of what remained of them by the American army. But the thing has been managed.

In September the bureaus of planning and engineering were brought together under a unified Bureau of Construction. They have turned baccarat rooms into offices, stables into warehouses, chateaux into sanatoria. Their commissions for the various departments have had to do with hospitals, demountable dispensaries, wooden barracks, coffee stands, rest stations, lunch wagons, infirmaries, canteens, demountable wooden hospitals, laundries, evacuation sheds and operating buildings at various points in France, together with warehouses and children's shelters in Belgium. Sixty contracts totalling 2,000,000 francs have been let and sites and buildings inspected for all branches of the work. The bureau is entering upon a schedule of construction of recreation huts at every base hospital of the American army. The architectural and building problem in the devastated district has been investigated, equipment gotten together and, as already noted, a beginning made for participation in the large work of reconstruction ahead.

In September also, transportation, purchase, insurance and stores were brought under a combined Bureau of Transportation and Supplies. The existing organizations in Paris were not, in personnel or equipment, prepared to handle the large work this bureau has undertaken, any more than a local railroad would be able to swing the job of a trunk line.

Nor in purchasing was the Red Cross so equipped until late in September, when seven of the most experienced purchasing agents available reached Paris to try their mettle. At the start, when the general lay of the ground was still a matter of guess-work, purchases had been made for each department as requisitioned, or goods stored for them individually. The business quickly outgrew this method. Items from all departments, entering into the elaborate budget for the six months beginning November 1, are being lumped and buying will be for a stores account. A purchasing committee of five has been organized so that items which will be needed can be forecast regularly in advance with the assistance of the persons who are dealing with the actual needs of the departments.

To show the variety of things which have been purchased in the first three months, these items may be noted: Two complete portable saw mills, planing mills and necessary shafting, two portable engines, four concrete mixers, four portable rock-mixers, two gasolene tractors, fifteen cystoscopes, one hundred chloroform masks, twenty-five microscopes, two hundred and fifty scarifiers, 5,000,000 rolls of absorbent cotton.

War conditions have made it difficult to buy in France. Three years of war have drained all Europe of reserves and of the conveniences of work. It lacks men; there is a shortage of rail transportation. The Red Cross has entered the field at the end of those three years, at a period of decreased production and of very much increased consumption due to the demands of the American army. If its purchasing agents want to buy three tons of coal for a garage they must get a permit from the French war department. If they want to buy beds in quantity they must get a permit allowing the French manufacturer to buy the material to make into beds. The American army has established a war purchasing board in Paris, and to avoid conflict the Red Cross makes its purchases only after consultation and also in cooperation with the French military and civilian authorities.

On the other hand, American supplies are 3,000 miles away; and when are added the general tonnage shortage and the strain of supplying the United States army (which must of course be given right of way), there is no real certainty of getting materials ordered in America.

In spite of the difficulties of European purchase, therefore, the Red Cross is endeavoring to buy in all markets. Stores will be gathered to care for the situation even if the American deliveries fail. Three thousand tons of shipping space per month have been asked for hospital supplies and other materials from England, in addition to 20,000 tons of coal per month. Purchase and even manufacture in England, Switzerland, Sania nd Portugal will be gone into.

From five trucks (and arrangements with the hauling companies) which the Red Cross took over from the clearing house, it has built up in less than four months a transportation section divided into six main branches, with an assistant director in charge of each:

Department of ports, with receiving warehouses at seven points, representatives at eight. At one port, 6,000 square meters of wintshouse space have been leased, with a capacity of 18,000 tons; with modern cranes of 20,000 pounds lifting power; and with facilities long the cars at a time or as many as sixty cars a day (600 tons). At another port, thas leased five warehouse to serve the variety of the port, has a ten-ton crane and five motor trucks and an office force of the port, has a ten-ton crane and five motor trucks and an office force of the presson, eight labor forems, two carpenters, wy ardmasters, one master stevedore and twenty to sixty laborers. Over 800 tons were shipped from this port by rail in one day.

Department of Paris and environs, in charge of all camions in all Paris terminals, with a station force of twenty-nine foremen, subforemen, laborers and inside and outside rolling-stock inspectors.

Department of staff cars and personal service, for recording and routing all personal cars on trips in Paris to the front and to all parts of France.

Department of outside Paris, with equipment permanently located in twelve towns and cities, advance warehouses in six. Department of garages, responsible for the physical condition of

all cars in Paris, all repairs and new construction of rolling stock. Here are three garages and a force consisting of one manager, four assistant managers, five foremen, 130 chauffeurs, three bookkeepers, two cashiers, sixty-three mechanics and miscellaneous laborers.

Department of rail shipment from the ports and from Paris.

This enumeration, and the details that make it concrete, afford as good an index as any of the new volume of Red Cross operations. The situation was investigated when the commission arrived in France, and it was obvious that the cordinary transitaire could not be depended upon to do its hauling. The occasional extraordinary congestion at the ports, together with the details of red tape, the customs and the general competition made it essential to move quickly and build up an organization to take care of the Red Cross work. On October 12, four months after the Red Cross Commission it-self landed, its transportation organization was ready to take care of any amount of merchandise consigned to it at any port in France. The condition of war together with the abnormal competition for transport, make it necessary to rehandle goods a great many times.

One hundred and seventy-four touring cars, 131 camionettes, 133 camions and seventy ambulances constitute the present rolling stock of the bureau. It is today prepared to handle 1,500 tons a day by camion, 655 by camionette, or 2,155 tons in all. Additional cars contracted for include 150 Fords, 115 touring cars (light, medium and heavy), forty five-ton trucks, forty four-ton trucks, fifteen two-ton trucks, and twenty one-ton trucks; while the operating force will be brought up rapidly to a total of 900.

The warehouse chart of the stores section shows twenty-one storage centers, either in existence or prospective, giving the American Red Cross 5,000,000 cubic feet of space against 50,000 three months ago. The largest unit was added in September, a sugar warehouse in the wholesale center of Paris, a five-atory stone structure with twelve steam hoists, two rail-way tracks on the outside and two on the inside. But the quickest and most picturesque finding of storage room came in taking over the old gable buildings on the Chemin Vert, where in the days before the taxis a Paris cab company had stalled a thousand horses and the cabs they drew.

#### Digging Out Old Courtvards

Titisse stables were in an exceedingly dilapidated condition, the roofs were practically useless, the windows broken, the doors eaten away by time and hungry cab horses and there was an accumulation of manure which dated back for many years. Six families inhabited different parts of the premises; the lighting was done by candles and oil lamps and the place was filled with rats, rubbish and broken-down carriages. Nevertheless, the stables would give a million cubic feet of storage space and that was hard to find these days in Paris.

With picks and wheelbarrows, the 500 tons of manure were gotten into the yard in four days' time, to be carted away by market gardeners. As the manure was removed, a crew followed up with strong disinfectant; carpenters put in windows, repaired doors and floors; masons replaced the entrance gate which had fallen down from old age; roofers repaired the gutters and slates; artiss from the Latin quarter saved \$1,000 by building the shelving in the packing room; concrete runways were constructed over the old cobbled pavements; electric lights were installed, fire extinguishers and water buckets placed; the lofts were divided into compartments, lettered and numbered, and one of them turned into a dormitory for fifty Algerian workmen supplied by the French government.

The greater part of this work had been done while discussion of the lease was going on; and before September 1 the Red Cross was receiving goods at the old stables, by October 1 they were well filled. They have a look about them that would fit into a Dickens story. Courtyard after courtyard opens out one from another and the rolling camions are a contrast to the clattering cab horses which filled the cobbled wars in the old daws.

There is another contrast. Since October 1, the Red Cross has accepted in the United States only supplies shipped to its general stores (not to individual organizations) and all goods must be sorted and packed in case lots on the other side of the ocean. One room at the converted stables was turned over to re-sorting the final mixed consignments, those in transit or on the wharves at New York. In moving in, a big pasteboard box burst open and the proverbial white-satin, highheeled party slipper actually thrust its toe out for a last look Contrasting with this reminder of the missionary-box era in war relief, are some of the new units-antiseptic gauze, packed in gunny sacking as big as the cotton bales to be seen on a southern wharf and enough of them to fill a small wharf; pen after pen piled high with ponchos, corduroy breeches, pajamas, underwear; a great hay loft stacked to the gables with mattresses sixty high; a motor van in the courtyard discharging night clothes from a Paris garment factory; for over and above all it receives from war-time workrooms and sewing groups in France and the United States, the Red Cross has enforcedly entered upon a wholesale business as big as that of a string of department stores and drawing on commercial manufacturers in order to measure up to the work it has set out to do.

The new order is not a sudden break, but a logical development of the work of the American Relief Clearing House. This was founded by former Ambassador Myron T. Herrick to bring order out of an earlier "tangle of good intent." In the first days of the war the French ports were littered up with boxes addressed to the "American Embassy," the "American Chamber of Commerce," and "French Army," just "France." People wanted to help and so sent things along without notice to those for whom they intended them or without knowing to whom to send.

The original idea of the clearing house was to serve as a center of information; to advise people what to send, where it was needed and when; a clearing house of both information and material. The work began in October, 1914; French and American committees were organized, freedom of customs obtained, free sea freight given by the French line and free transportation from ports to Paris by the French government. The War Relief Clearing House was organized in New York as a complementary committee for systematic collecting and forwarding. At the start, 75 per cent of the supplies came in addressed to the clearing house, to be placed wherever in its discretion they would do the most good; 25 per cent it handled without discretion, practically as an express company, taking charge of the goods in New York and delivering them to addresses designated in France.

In course of time new relief committees sprang up in the United States with branches in France, and French committees sent representatives to America to make appeal. This greatly augmented the volume of help and good will, but it had other results. By last spring the original proportions had been reversed. The clearing house was acting merely as an express agency with respect to 75 per cent of the goods it handled; it was free to distribute but 25 per cent in a systematic way so that needs that had not been blazoned in the streets would not go unmet. There was no way of checking up what a given society was getting; a few received direct and applied to the clearing house besides, thus getting double, while there were big gaps elsewhere. Some one in America. knowing a friend working in a given hospital, might raise a fund and send over a thousand blankets; yet that hospital might have as many blankets as it needed while at another point people were nearly freezing to death.

The clearing house brought American donors to the point of marking the contents of boxes, but there was always great waste in not passing on the servicability of shipments until they reached Paris and great delay in having to sort and repack them here. In the beginning, the second-hand material which came was of fair quality; then America seemed to be cleaning house; for instance, out of one lot of a thousand cases the contents of perhaps 900 had to be burned. Later, the second-hand material was for the most part good, but not sufficient in quantity. And while people at home were willing to contribute money, they seemed disinclined to have goods bought outside the United States.

The result was that the clearing house never had a sufncient accumulation in case of emergency. At the time of the first offensive against Verdun in the spring of 1916, for example, it sent in what supplies it had in hand and appealed for clothes, food, etc. But it was six weeks before more arrived from the states.

The American Red Cross entered upon its new work in France just at the time that the French steamboat line had notified the clearing house that it could no longer supply it with free space; and in view of the subsequent shipping situation, the heavy torpedoing and the army demand for tonnage, it is considered not improbable that the clearing house, had it continued, would have had to give up handling anything but money. It retired from active operations and a large part of its personnel volunteered to engage in the Red Cross, which was confronted with a double problem; to deliver a vastly increased bulk of supplies-medical reserves for the American army; tools and equipment for rehabilitating the devastated region; food, clothing, household goods for refugics-in quantities which would tangibly reinforce France in meeting the needs of the coming winter not in spots but as part of a comprehensive plan; and to attempt this in spite of the fact that America's entry into the war absorbed the available shipping.

It is the theory of the Red Cross that the tonnage from the United States to the continent should be controlled absolutely by the War Department; the expeditionary force should have the right of way. What space can be spared, the government can assign to one or two responsible agencies which, with this restricted service, should scheme it out and carry it on so that the most needed supplies will reach the points where they are most needed. To this end the Red Cross has built up its purchase, transport and stores services; set about European buying and manufacture and purchased such space as it can secure on independent vessels. To this end, as we have seen, on the basis of the changed situation and on the basis of the clearing house experience, it largely reserves its tonnage for necessities that cannot be obtained in France, requires them to be sorted and packed on the other side, receives them only if consigned to its general stores, and distributes them to its own branches or to other agencies by the procedure already outlined through its surgical dressings service, its hospital supplies services and its departments of civil and military affairs.

There is an enormous amount of work to be done, as the Red Cross sees it, and it is committed to a "policy of cordial cooperation with effective American agencies in France and with French agencies, governmental and private, through which America can help."

As in every other effort to bring organization and greater carrying capacity into a group of loosely related undertaking, the attempt of the Red Cross has not been without friction. It has made mistakes but they are not irretrievable. It has cast American war relief in France in an entirely new mold, which should manifold its effectiveness every day that comes.

The American Red Cross has attempted something more far-reaching. This war has toppled over all existing notions of weapons, tactics, numbers; a war not of armies but of nations; of nations fighting not on the battle line alone, but under stress throughout their length and breadth. It would be strange if the conception of the war work of the Red Cross should not be changed also by this situation. It means ministration to the sick and wounded, friend and foe, as ever, But if work already done and plans under way are a gauge of the future, it means engineering in shattered villages, health education in a hundred centers, relief through a thousand agencies. It means canteens and recuperation camps, coal and farm machinery and rabbits and camions. It means work carried on in gas masks and in cellars, in tuberculosis wards, in tenements, in operating rooms and in stricken homes. It means striking hands with soldiers, rapatries, mutiles, refugies innumbered. It means letting all France know in another way that America is here.

#### DANGER OF UNEMPLOY-MENT AHEAD

MINOUS danger signals are appearing in the records of some of the federal and state free employment offices, giving warning not only of a shift of employment but of actual increase in unemployment. The completion of the great cantonments has released thousands of workmen, both skilled and unskilled, who have been employed many months in building them. Carpenters, steamfitters, plumbers, electricians, cement finishers and day laborers are flocking to other points where they expect to find more government work. Two-thirds of those who sought work at southern cantonments or shipvards in Gulfport, Miss., Houston, Tex., Charleston, S. C., Jacksonville and Tampa, Fla., are said to have found no work and not to know where else to seek it.

At the distribution department of the United States Immigration Bureau in Chicago, as well as at the two Illinois Free Employment Offices in that city, many more applications for skilled and unskilled work have recently been received than calls for workers. This sudden reversal of these officials experience in having many more demands for labor than they could supply during the past year or two is due both to the completion of so much government work and to the usual suspension of outdoor work at the approach of winter.

Such surplus of labor as exists may prove temporary, a congestion at certain centers of industry to be relieved by adjusting the supply to the demand for labor elsewhere, including the possibility of a great housing development by the government or financed by it. But as this is by no means assured, country-wide measures to relieve and prevent a situation fraught with local menace and national peril may be needed immediately.

In New York, on the other hand, the demand for help at the five offices of the Bureau of Employment was slightly larger in November than in the same month last year. The demand for help also exceeded the number of applications for positions. In the monthly bulletin issued by the bureau it is suggested that the shortage is more apparent than real, due to high labor turnover. The workers, like everyone else, are very restless; beset as they are by rumors of every description concerning higher wages to be earned elsewhere, they are constantly leaving to seek new positions.

That the deuand has greatly fallen off in some quarters is indicated by an experience of the New York bureau with 500 workers in a single trade who recently were laid off. In order to find work for these men the bureau communicated with fifty-five employers in Greater New York who employ the kind of labor in question and received replies from only five of them.

## DETROIT'S FOUR HUNDRED A SINGLE FAMILY

GOTHAM'S "four hundred" are Well known throughout the land. But how many know that Detroit has also its four hundred? They include no society leaders, none is over seventeen years of age, the majority are little children, many are young babies. Nearly all of them began their lives with some handicap. Some are orphans, others were abandoned, many have been neglected by their parents, some ill-treated and abused; there are "children of sorrow" among them and those who must suffer for the sins of their parents.

Curiously enough, the little children

Robert W. de Forest, president; Paul U. Kellogg, editor; Arthur P. Kellogg, sceretary; Frank Tucker, Irenaurer. 10 cents a cept; 33 a year; fereign polys, 415; Canadian, 75 cents; Grappett, 1917, by Survey Assertites, Int. property, 1917, by Survey Assertites, Entered as second-class matter March 25, 1909, at the post office at New York, N. Y., under the Act of March 3, 1879. under the care of the Children's Aid Society and the local branch of the Michigan Children's Home Society number just four hundred. Every effort is being made to fit them to become happy, useful members of the commonwealth. The two agencies, wishing to avoid all duplication of effort and desiring to make use of the best characteristics and material in each organization, have decided to work in even closer cooperation than at present.

Instead of each agency employing, for example, a highly trained executive to take charge of all investigation and all protective court work on behalf of children, and each society engaging a separate executive to supervise the children placed out in private family homes for boarding or adoption, by the new arrangement the societies will work so closely together that the supervisor of investigation for the first will also investigate all cases for the second and the supervisor of the child-caring department of the second will also have charge of all the boarding and adoption homes of both agencies.

#### PROTECTING GIRLS IN ARMY ZONES

ONE million dollars isn't quarter Council of the Young Woman's Christian Association decided when they met in October and compared their June appropriation for war emergency work with the plans they have formulated for protecting and aiding women in war and army zones from Petrograd, Russia, to Waco, Texas. The council took stock of the demand for its services and increased its budget to four million dollars.

lars.

For instance, in June \$300,000 looked like a huge sum for hostesses' houses at army camps. But now, with seven houses to army camps. But now, with seven houses completed and in need of running expenses, with nineteen under construction and with some eight others contemplated, \$300,000 is a mere drop in the bucket, a paltry third of what is needed.

And ask the boys themselves if the

WHERE THE Y. W. C. A. 15 "AT HOME"

results aren't worth the expenditure. They will answer, first of all, that the hostesses' houses have made it possible to meet the folks from home in a quick and simple way instead of waiting, often in vain, at a packed railway station. In the second place, the soldiers will vote unanimously that it is far pleasanter to entertain their guests in a comfortable, cheery reception-room with a cafeteria nearby than in the streets of the straggling cantonment. Finally, they will give hearty appreciation for the hospitality and friendliness of the women in charge of the houses.

But entertainment and care for the women friends and relatives of soldiers are only a small part of the Y. W. C. A. program. In the munitions towns the increased force of female operatives must be housed and fed; in the vicinity of training camps young girls must be offered clean, wholesome recreation and normal opportunity for meeting the young soldiers. Especially must the Negro girls in the Southern towns where cantonments are located be protected and given attractive living and working conditions. The interests of all these girls are taken into account in the new budget. a sum of \$200,000 being raised for the welfare of the colored girls alone.

Last but not least, the Y, W. C. A. has undertaken to extend its benefits to the tired factory girls in Russia and France. Twelve women are already in France conducting rest rooms and canteens where a good meal may be secured for about twenty cents. Two secretaries are in Russia for a similar purpose, and five more have sailed. The enormous need of such work is revealed in a letter to the national board from Mary Dingham, recently the industrial secretary of the Y. W. C. A. in New York city, and now in charge of a canteen at Billiancourt, France. Miss Dingham writes:

The wounded soldier is seen at every corner and one's sympathy is constantly aroused, but the thousands of weary women toiling eleven hours a day in the munitions factories, traveling often an hour night and morning, taking care of heir children, enting with men at the poor but expensive cafes, are not so much in evidence, and therefore their need is less dramatic and appealing. Then these women are earning better wages than formerly—perhaps as much as eight or taken part in strikes, and these things have counted against them.

It takes clearer vision to see that this great group of middle-class women is the backbone of France and the mothers of the future French citizens, and that if they are broken physically and morally by this unnatural strain, in the years to come the French oppulation will be too largely composed of crippled men, worn-out women and children who have been handicapped in their start in life.

#### INCREASE OF MAN-LESS FAMILIES

HE current experiences of our great relief organizations register as accurately and continuously the changing industrial and social conditions as the weather bureau states the atmospheric conditions and they should prompt as constant forecasting of the changes to be prepared for in advance. The United Charities of Chicago reports an increase of 19 per cent in the claims for relief during October over the demands of the same month a year ago and these claims were 13 per cent greater than in the preceding month of September. With 11.669 families and their 52.011 members to deal with and with 7,507 of these families, including their 33,781 individuals, under more or less continuous special care, the Chicago society claims to carry "the heaviest load of any organization of its type in the United States."

Because indicative of war-time tendencies, the fact that most of these families under constant care were found to have no fathers at home or fathers at disabled from earning capacity is significant. Death had left 1,459 of them fatherless, 978 men had deserted their families, 69 had been divorced and 191 legally separated, while no less than 4,317 of the fathers found at home were incapacitated from earning the family support.

During the year ending September 30, illegitimacy increased from 1.8 per cent to 3.1 per cent and non-support from 11 per cent to 15.9 per cent, both probably being distinctly war manifes-The physical disabilities distations covered were so many more and so much more serious that last year that over 500 more cases needing hospital or sanitarium care were found, 1,662 in all. Heavy drafts have been made upon the staff and the directors of the United Charities to fill positions in war work, which required all or a large part of the time hitherto devoted to the society's work.

#### ORGANIZING THE NEW ARMY MORALE

THE Reserve Officers' Training Camp at Fort Sheridan, Ill., has the distinction of neutron its "morale" into a permanent practical-copression that is likely to be duplicated elsewhere. At the suggestion of the commandant, Col. James A. Ryan, and with the active cooperation of many of the men, headed by the camp director of morale, the Rev. Myron E. Adams, the Fort Sheridan Association has been established, with Colonel Ryan as its president, Mr. Adams as its secretary and a large proportion of the 6,000 men who have taken training there in the membership.

The purpose of the association is to promote the cooperative fellowship of the officers in its membership. This is to be sought by maintaining head-quarters at Chicago and Paris, with a rest resort and sanitarium where men on furlough may recuperate and convalesce at some quiet, healthful location within easy reach of the war zones in Europe. A monthly magazine will circulate among the members.

The activities of the association include personal service in making loans to officers, in helping them care for their families and in caring for the man himself in case of casualty; a legal department, looking after pensions, compensations and insurance, as well as personal legal matters; an information and registration bureau, reaching officers at the front and at home and keeping them in touch both with each other and with their families. In all this work active cooperation will be maintained with state councils of defense, the Red Cross and the Y. M. C. A.

After the war the association proposes to gather, preserve and publish biographical data concerning its members, to hold an annual reunion, to support national measures requiring military experience and to assist officers to find their place in the working world on their return to civil life.

For educational purposes the interchange of experiences will be sought through the magazine, an extension course will be offered to continue the training of officers while awaiting call, and work with the company units will be helped by a little manual which has already been published and distributed among the recently commissioned of-ficers. In this little booklet the officer's responsibility for his men is borne home to heart and conscience as well as to professional pride. And then the ways of promoting the enlisted man's mental training, physical welfare, recreation, moral qualities and religious nature are suggested very practically and encouragingly.

#### WAR-TIME USES FOR THE SHAKER COLONIES

W. HEN "Mother Ann" and her Shaker pioneers came to this country from England in 1774 they endured for two years the scarlet sincipulness of New York city and then retired to the quiet village of Watervillet upstate. There they founded the first colony of their sect in the new world. Not long afterwards other Shakers settled in the neighboring community of New Lebanon, now Mt. Lebanon, and the countryside soon rang with the fame of their cooperative industrial enter-nrise.

For a time converts added to the numbers of this cellibate sect and many communities were established in New England, New York, Kentucky and other states. Today there are fewer than a thousand Shakers in the whole United States. Many of their once populous villages are almost empty, while others have long since been abandoned. Interesting proposals have been made from time to time of uses to which these sites might now be put.

Most of the Shaker villages comprise from several hundred to several thousand acres of land. Large, substantial houses and farm buildings have been kept in good repair. A social worker from New York city, on a recent visit to one of the Shaker colonies upstate. had a long talk with a Shaker sister, who was also a trustee of the village. This colony has from 1,500 to 2,000 acres and more than sixty buildings divided among five so-called families. The size of the community is not revealed by the inhabitants to the casual inquirer, but indications were that it did not exceed thirty members, with a number of children as wards.

The social worker was told that the Shakers were puzzled to know how to meet the present shortage of agricultural labor. Their land is farmed by paid help. The sister was well pleased, therefore, with the social worker's suggestion that the Shakers offer to take

groups of high school boys who could learn agriculture under competent teachers and who would, incidentally, increase the yield of the farm.

Another suggestion for the use of these sites is that they be converted into farm colonies for the feebleminded and epileptic and other classes of public wards. There is precedent for such a use. The Shaker colony at Sonyea, N. Y., was sold to the state in 1895 for the Craig Colony for Epileptics, and its inhabitants retired to the mother colony at Watervliet. Another village, that at Shirley, Mass., has been purchased for a state reformatory for adolescents.

Two old Shaker villages are known to be in the hands of private individuals willing to sell. One is at Canaan-Four Corners, N. Y., which comprises a group of eight buildings and 453 acres, and is offered at \$15,000. At the Watervliet colony one of the four "family" groups is for sale for \$20,000, a property comprising 400 acres of good land and a number of buildings in good condition. A New Hampshire colony is similarly on the market. At Tyringham, Mass., a colony has been disposed of and is used in very small parts. The community at Enfield, Conn., has been bought by a large tobacco company. The company presumably intends to work the land, but so far as is known has not yet put the buildings, still occupied by a few Shakers, to any use. Why should not feebleminded but able-bodied boys occupy the buildings and work the land?

Dr. Walter E. Fernald, superintendent of the Massachusetts School for the Feebleminded, writes to the SURVEY in regard to using the Shaker colonies:

It would be a wonderful piece of good fortune if one or more of these properties could be taken under the right of eminent domain, so that the fertile land, the buildings, the barns, the storehouses, the canning plants, etc., might be used for the work of defectives or delinquents or any other class reactly suitable for this purpose, but they are only nominally occupied at the present time by a few old people.

Naturally at the present time the question suggests, itself as to whether these numerous properties so largely unutilized could be put to some purpose in connection with the war. Might they be considered for convalescent hospital purposes? The experience of Canada would seem to indicate that many of the requirements for such hospitals would be met by these Shaker buildings. In a recent article on this subject Dr. John A. Smith, secretary of the New York State Department of Health, summarizes an interview with Ernest N. Scammell, secretary of the Military N. Scammell, secretary of the Military of the

Hospitals Commission of Canada, by outlining the following requisites:

The location of the convalencent home should be determined not by nearces to the point of debarkation, which might easily become a leading consideration, but rather on these three principles: (1) It should be within reasonable distance of the homes of the convalencents, but preferably 25 or 30 miles outside a large center. (2) It should be in a healthy location. (3) It should be near good medical service.

Mr. Scammell recommends that no convalence tho spirits a should be organized for fewer than 500 patients. The administration of smaller units is more expensive and less efficient. Every convalence in hospital that is should contain improved hospital equipmen, including electrical and hydrotherapeutic facilities; it should contain in operating room, and, by no means of least importunce, it should contain in recreation facilities; it should contain in recreation facilities; it should contain in recreation facilities; it should contain in addition to recreation facilities; it should contain to addition to recreation facilities.

While, of course, not only the improved hospital equipment, but also modern plumbing, lighting and heating facilities would have to be provided if these buildings, planned as residences, workshops and barns, are to be used for so different a purpose, still it is to be remembered that they were very substantially built, and that they already have good workshops where the Shaker industries have been carried on, and also excellent facilities for agricultural training and practice. One great advantage to be considered in the use of already existing buildings, rather than the erection of new ones for such purposes, is the great saving, not only of materials, but also of labor, both of which are becoming increasingly valuable. The farmers of Long Island are in a state of consternation at the present time because after the government has called upon them to cooperate in raising crops it has offered such good wages to laborers in connection with the construction of the great concentration camp at Yaphank that the farmhands are abandoning agriculture for the building trades.

If the handful of Shakers that still remain in possession were willing to cooperate with the government in such an undertaking, the members of each so-called family could probably be accommodated in one of the nine or ten buildings which constitute each family group, leaving the others for this patriotic purpose. While the Shakers are in principle pacifists, their pacifism is rather more of the Quaker quality than of that of the more ardent modern spirits, and they seem to be impelled by patriotic principles and would probably be public-spirited enough to welcome an opportunity to serve their country by putting at its disposal their valuable unused property. At Mount Lebanon at a recent visit an American flag was noticed flying from a gate-post.

## **Book Reviews**

CREATIVE INTELLIGENCE

By John Dewey and others. Henry Holt & Co. 467 pp. Price \$2; by mail of the SURVEY \$2.16.

Creative Intelligence, in spite of its attractive title, is not a treatise for beginners in humanistic philosophy. Let such he referred to the earlier writings of Dewey and Schil-ler, and especially of William James, or even to Poincare's Foundations of Science, there are some who like to begin, as it were, at the top of the pyramid and work downbeginnings. To these, and to anyone familiar with the concepts of humanism, Creative Inselligence is to be recommended.

The title of the book suggests a point of view divergent from that of Professor Bergson, creative intelligence es, creative impulse. Int n gence cooperates with feeling in the making of "values," and around these values sentiments (complex organized emotions) are constructed. Laws and axioms are not intuitively known. Neither have they descended from on high, nor are they the product of fathomless unconscious processes. They are the result of experience-of the discriminating reaction of human intelligence on that en-

vironment of self and world within which men are pursuing satisfactions.

No lengthy review of this book has place ere. Most readers will find interest in Harold Chapman Brown's essay on Intelli-Kallen's essay on Value and Existence in Philosophy, Art and Religion, while the essay on The Phases of Economic Interest by Henry Waldgrave Stuart is to be recom mended to every economist. "The egoism of men is no fixed and unalterable fact," says "As an actual social phenomenon egoism is merely a disclosure of a certain present narrowness and inertness in the na-. . It is on a ture of the individual. . par with anemia, dyspepsia or fatigue, or any other like unhappy fact of personal biography." A business transaction involves an experience as to the world's value for us and a further experience as to our own value for the world. Economic exchange is thus as-similated to that give-and-take between similated to that give-aud-take between self and surroundings, which Prof. James Mark Baldwin calls "the dialectic of per-sonal growth," the process through which human nature creates itself through appropriating the world. Choosing between objects that we may want to purchase is really a choice between experiences and ultimately between different levels of the human rela-

The reviewer is conscious that this para-phrase of Professor Swart's essay will be obscure to most readers. The essay itself will be obscure to most people on first, sec-ond or third reading. This is true of all the essays in the book; but it does not mean that essays in the book; but it does not mean that they are unsuccessarily obscure. They are the intimations of a new mode of appreciating one's self and one's world which is just finding its way into abstract thought. We finding its way into abstract thought. must be patient with the obscurities of those philosophers who are doing pioneer work. lust as skating is difficult to the beginner, so a new point of view in philosophy is difficult to the heginner.

In spite of these appreciative remarks, one cannot help sighing for that exposition at once vivid as lightning and picturesque as

romance, which William James was always able to provide for anything he had to say. Or, even, we may sigh for the simplicity of Ptofessor Dewey's writing where it is addressed to the teachers of children or to the general reading public. Creative Intelligence is suggestive; it represents a labored, though perhaps infinitesimal, advance in humanistic thought. It is not brilliant, ro-mantic, popular or inspiring.

Inna Courses.

THE NATION'S HEALTH

By Sir Malcolm Morris, M.D. Funk & Wagnalls, 152 pp. Price \$1.25; hy mail of the Survey \$1.38.

The Nation's Health is a direct product of the policy of "candid but not unrestrained discussion" approved by the British Royal Commission on Venereal Diseases, of which its author was a member. While it deals with conditions its England, it is almost equally applicable to our own situation in America, and will not only be useful to those who are directly interested in the public health problems of venereal disease, but will also be valuable to any reader who seeks a clear and simple statement of the facts. Unlike the splendid contribu-tion to the cause of social health, The Social Disease and How to Fight It, by Mrs. Creighton, with its moral emphasis and poignant appeal to women, Sir Malcolm's book is a "simple exposition of venereal diseases, with special reference to public health." He describes clearly and accurately the nature, distribution and economic effect of syphilis and gonorrhea, using terms easily understood by the layman and building up a compelling indictment that adds force to the remedies proposed.

These follow closely the recommendations of the royal commission, comprising provision of facilities for the diagnosis and treatment of these diseases and the spread of knowledge in regard to them. Sir colm, however, reverses the order of these proposals "to emphasize how much more desirable it is that disease should be avoided than that it should be cured," and shows how the work of spreading the light may be helped forward by frank discussion, by education in the home and school, hy voluntary organizations of various kinds and by the printed word, though he frankly recognizes the dangers of ill-judged efforts. His hrief account of the National Council for Comhating Venereal Diseases, representing as it does medicine, religion and social and philauthropic interests, is especially suggestive of the leadership which such a volunteer organization, in a large degree analogous to the American Social Hygiene Association in

this country, may give. The provision at public expense of facili-ties for diagnosis and treatment to every venereal patient who is willing to take advantage of them was made mandatory upon local authorities in Great Britain by an order of the Local Government Board in 1916. The scheme of this work is outlined and such topics as notification of venereal diseases, suppression of quarkery and quark advertising, penalties for wilful communication, detention of infected prisoners and the like are briefly presented. The policy of regulation of prostitution is shown to be a complete failure-"one of those seeming

short cuts which prove to be blind alleys." Of especial interest is the discussion of venereal disease and marriage and of the

Poses to marry while yet uncured.

Sir Malcolm is thoroughly convinced that the war, far from excusing delay on grounds the war, far from excusing actay on grounds either of expense or any other, makes im-mediate aggressive action indispensable to England's future. He feels the gravity of the problem, but there is nothing of pessimism in his outlook toward a triumphant issue for this crusade.

IAMES H. FOSTER

MEDICAL RESEARCH AND HUMAN WELFARE by William Williams Keen, M. D. Hough-ton Miffin Company. 159 pages. Price \$1.25: by mail of the Survey \$1.35.

That Dr. Keen's lectures would prove an illuminating account of recent medical re-search was predicted by the invitation from Brown University to deliver the Colver Memorial Lectures this year. And all reports of the remarkable medical service as battlefronts arouse a civilian interest that makes timely the publication of such lectures. In brilliam, scholarly, but quite untechnical style, Dr. Keen tells of the work of Pasteur, Lister and many others whose names are still in the course of becoming a national asset, but whose achievement is precious today.

The successful experiments in anthrax; the conquest of yellow fever, typhoid, ma-laria and hookworm; the possible control of tuberculosis, cancer, diphtheria, and much else-these are told with the honesty of a man who has known what it is to fail in earlier years in his fight against those diseases, and whose enthusiasm in the victory of the new methods is the joy over a service

to humanity.

It is significant, too, that a lectureship whose purpose is to furnish "distinctive and valuable contributions to human knowledge should choose as its theme medical research Brown University read aright the signs of the times in believing that this theme was tures, and it chose wisely the lecturer. Major Keen was recently appointed as one of the American commission to write a medical history of the Great War.

GOOD HOUSING THAT PAYS

By Fullerton L. Waldo. Harper Press. Philadelphia. 126 pp. Price \$1; by mail of the SURVEY \$1.10.

This little book is full of information for housing and social workers. It tells the story of the Octavia Hill Association of Philadelphia from its heginnings in 1896, when title was taken to its first five houses, to its present-day development in 1917, with 403 houses tenanted by 704 families under its care

It tells of more than the improvement and management of houses and the friendly oversight of their occupants, which is the oldest and probably the most widely known work of the association. The book is almost a history of the housing movement in Philadelphia, and touches on many of the other social improvement activities as well.

The Octavia Hill Association was an out growth from an already established civic organization, and has been in active cooperation with other agencies, both municipal and private, which are working for the hetterment of the city. The association has financed and directed investigations, prepared and furthered the passage of legislation, helped the city in its administration of tenement laws and had its part in the genesis of the Philadelphia Housing Commission, or Housing Association, as it is now called. And settlements and playgrounds have grown up from the association's enterprises.

The first chapter of this Philadelphia volume, describing a Philadelphia work, is devoted modestly to an account of the life and achievement of Octavia Hill, of London, from whom the association took its name and in part derived its inspiration. But as the story goes on we see that the association has developed on its own lines, differing in some respects from those followed by Miss Hill It mot only acts as agent for property held by others, as did Miss Hill, but it is itself a purchaser and owner of houses. Also, through the Philadelphia Model Homes Company, it has built new improved dwellings. And the association offers its services to outside organizations or individuals for planning and supervising the construction of new

Its many-sided activity is described in a live and interesting way and with practical, frank detail on both the husiness and the human side, which will make the book of value to other workers. Its form is one to give pleasure to the reader. It has good print, good paper and binding, and is well

illustrated.

There is an evident sincerity of purpose which commands respect in its attempt to give for the benefit of others the experience of an association which for over twenty years has been trying with success to put into practice Miss Hill's dictum: "The inhabitants and their surroundings must be improved together."

EMILY W. DINWIDDIE.

OUTLINES OF AGRICULTURAL ECONOMICS. UTLINES OF AGRICULTURAL ECONOMICS. CLASS BOOK OF QUESTIONS AND PROBLEMS. By Edwin G. Nourse. University of Chi-cago Press. 95 pp. Price 50 cents; by mail of the Survey 54 cents.

The readers and students of Professor Nourse's Agriculture and Economics, reviewed in the Suavey for January 27, 1917, will be interested in the publication by the University of Chicago Press of a class-book of questions and problems, based upon the earlier volume. The questions are searching, the problems practical, and will, with several good charts, go far to increase the value of Professor Nourse's book to all who have the privilege of making use of it.

THE SPIRITUAL INTERPRETATION OF HISTORY By Shailer Mathews. Harvard University Press, 227 pp. Price \$1.50; by mail of the SURVEY \$1.58.

These interesting and timely lectures de-livered at Harvard in the Phillips Brooks House, on the William Belden Noble Foundation, strikingly exemplify the author's remarkable facility for brilliant generalization. Ignoring the arbitrary and untenable division of history into "sacred" and "secular," he identifies the physical and spiritual, economic and personal, political and religious forces which constitute historical processes and

results. Conceding large influence both to the geographic and economic conditions which affechuman activity and destiny, he emphasizes their failure to interpret history without allowance for the still stronger influence of personality and spiritual forces, among which he rates the personality and spirit of Jesus quent failure of individual Christians and organized Christianity to interpret Jesus' own gospel, he hopefully claims a growing recognition that essential Christianity is not only in aecord with the historical tendencies toward progress, but offers both its ideal and its dynamic

Never leaving his discussion with a mere academic conclusion, he brings every argument and suggestion to bear upon the obligation and opportunity of the individual and

the church to add their all to increase the momentum of the cosmic tendency. He does not believe that "the faith in the supreme worth of democracy and even of individuals in which we once gloried can ultimately sink into a worship of a state organized for economic and military efficiency." He regards "the democracy of this newer age as well worth the struggle in which we are now involved, cooperating as it does with the pre-vailing tendency of social evolution." Thereto beget in men the sacrificial socialmindedness which God displays in lesus Christ," he concludes, "is the supreme social task of the church."

RECREATION AND THE CHURCH By Herbert Wright Gates. Chicago Press. 185 pp. University of Price \$1: by mail of the SURVEY \$1.08.

In the background of this valuable compendium lies most that has been written and experienced of the principles and practice of play; in the foreground are the summaries of and conclusions upon results. But recreational surveys of localities are insisted upon as the main dependence in meeting local needs and in carrying on and out recreational programs. With regard to questionable amusements, strong insistence is placed upon the principle of "discrimination rather than

universal prohibition. Illuminating instances are cited to show what may be done by churches singly or in groups to adapt recreation to different ages, instincts and periods of development and how they may either preoccupy the field so as to give less advantage to commercialized amusenients. Cooperation of the churches with the public authorities is urged, especially in the form of a recreation hoard, such as in Winnetka, Ill., represents the village authorities, the school and park boards and the churches. The Brick Presbyterian Church of Rochester, I've prick Prespyctian Church Institute, which is in Mr. Gates's charge, is a most suggestive example of what a single church is doing in making recreational facilities and directorship tributary to the church's character-building work and in making the church effective in its preoccupying, prepossessing work for the community.

A bibliography of play and recreation et-hances the value of this very useful hand-book, which cannot fail to increase the efficiency of educational and recreational workers in the church and elsewhere. C T

THE GROWTH BE MEDICINE By Albert H. Buck, M.D. Yale University Press. 503 pp. Price \$5; by mail of the SURVEY \$5.35.

The Germs of Medicine

as though food inspection and sanitary water-supplies were modern inventions and a public clinic nearly the deenice cri in health methods. Yet here are papyrus recerds showing that in Egypt priests were officially responsible for the inspection of meats

It would really seem

which were to be used for food, and for the public water supply; the Babylonians had theories as to what should be eaten at one season or at the other, and they laid their sick in a public place that all who passed might advise-a method perhaps cautionary for the onlooker rather than curative for the patient, but nevertheless showing a community interest in the fact of sickness. And it was a student of many hundred years before Christ who was thus reproved: "Thou hast abandoned thy books and art devoting thyself to idle pleasures. Thou smellest so strongly of beer that all men avoid thee.

Because it is easy to claim the good of our day as the best and the bad as the worst, Dr. Buck reminds us of the word of the Vienna master who bade his students "light their torches at the fires of the ancients. And it is to make possible this illumination that Dr. Buck has assembled from a wide range of sources material otherwise inaccessible, showing how the science of medicine "has attained its present power for good, and what chief parts have been played by many men in the attainment. For it must have taken a rare devotion to continue "practicing" when the reward for curing a slave was a few shekels, and the penalty for

Dr. Buck traces the story from days of astrology and superstition with their intermingled accounts of curiously successful surgery and clever diagnosis to the real be-ginnings in free Greece; he follows the varying social status of the physician as slave, priest, barber, to at last a professional rank; explains the long separation of medicine and surgery; recounts the distinctive contributions of Arab, Greek, Roman and given by the Renaissance.

An interesting and thought-provoking volume is this, when the material might easily have been treated as technical and specialized. The history has a social message and this not for the doctor only, but for every one who watches with interest all progress of matters medical, keeping one shelf of his library for books of background and perspective in his particular subject and in all with which it has interrelations.

#### COMMUNICATIONS

#### HOW TO FIND WORKERS

TO THE EDITOR: We had in all fifteen applications as a result of our advertisement in the Survey of October 20. Because we forgot to mention the sex of applicants desired, we had eleven applications from men, some of whom were very desirable, but as the work of the Consumers' League is concerned chiefly with working conditions of women and children, we, of course, prefer a woman for the position.

We had a special meeting of the board this morning in which it was decided to engage A. Estelle Lauder, a young women who ap-plied in auswer to our advertisement in the SURVEY.

JENNIE M. FELS. [President, Consumers' League of Eastern Pennsylvania.]

Philadelphia.

#### DRINK IN FRANCE

To THE EDITOR: Your number of the 3rd November publishes, under the signature of Elizabeth Tilton, an article entitled The Drink Problem in France-Conditions Facing Our Soldiers, which, though undoubtedly inspired by the best intentions towards our country, appears neither fair nor to the point. It is quite natural that the opinion in America should be concerned for the health of the American soldiers; but your description of alcoholism in France leads to the conclusion that your soldiers must fatally be exposed to the plague.

The problem presents itself quite differently, and I beg to ask your permission to rectify on this point an opinion wholly un-founded.

There is a question of alcoholism in France, as well as in other countries. The fact is unfortunately established. The newspaper articles which you quote prove at the very least that it engrosses the attention, that leagues have been constituted, that publicists make it the subject of newspaper and magazine articles and that public opinion is vig orously put on guard against the danger, at the same time as the legislature is asked to remedy the evil by the enactment of laws. But this problem of alcoholism is a problem concerning the interior of the country and the civilians. The army, in virue of the powers held by its chiefs not only over their troops but also over the whole zone of the front, has been secured against it by measures which, no doubt, are of great interest to you:

1. In the first line, our soldiers receive a pint of wine per day and now and then a thirty-second part of a "litre" of rum (and not a sixteenth). You must not lose sight of the fact that the soldiers in the trenches are often in the rain, sometimes in water and always in the open air. You must acknowledge also that they need to be warmed up and that they eliminate quickly. There is not, there cannot be, any case of drunken-ness in the first line; the trench protects against alcoholism even those who are inclined to it.

2. In the second line: a pint of wine; no alcohol

3. In the whole army zone alcohols are prohibited and, by reason of the difficulties of transport, the military administration and of transport, the minuter automates are the military "cooperatives" alone can receive wine. The troops are therefore fully prether behind, some traffickers may sell wine to the soldiers cantoned in the inhabited villages, but wine only and no alcohol. I believe that similar measures have been

taken by the chiefs of the American army in the zone of the front it is called upon to defend. They will have in your army the same efficiency they had in ours.

There remains for the soldier on furlough the danger of large cities, and this danger is a certainty; but is it not the same, whether the city is called Paris or New York?

Privates on furlough who cannot establish that they have a family to receive them are refused admittance to Paris, and if, coming from the front, they wish to reach a town either in the Centre or in the South, they have not the right to cross Paris and they must go around the city by way of the belt

Thus are removed the temptations which assail the soldier on furlough who has no home. Moreover, in all the towns of France, soldiers are forbidden to sit down at table in a café, outside of certain hours, and they cannot be served with any alcoholic drinks.

Let the chiefs of your army still further reinforce these rules, if they please. It is easy. The French authorities, on their part, will surely take all necessary steps to sup-press all deeds which might impair the car-

press all deeds which might impair the car-rying out of your interdictions.

Here is the whole problem. It is precise, it is solvable. The American army in France, like the French army itself, shall, by a few simple measures, be safeguarded from the danger of alcoholism.

I regret that your article did not treat the

problem as it presents itself. Notwithstanding the fact that the title put up the question very plainly, the author soon lost sight of it and indulged in drawing a picture of French alcoholism in general in a rather undefined design and under very dark colors. The con-clusions are hopeless: The plague is let loose in France; the American troops could escape only if the whole of France rid itself of it; but France not having done so, the American soldiers cannot therefore be pro-tected against the unavoidable vice. And, as the author does not take the trouble to suggest any remedy, the sole result of this article is to add to the alarm of the Americao families.

Legitimate concern for the health of your boys and the laudable intention of provoking boys and the laudable intention or provoking the adoption of measures for their protec-tion, do not justify such a description of the physical and moral health of my country. You invoke the respect of truth; but to accu-mulate all sorts of facts, undated and bor-rowed from all kinds of authors, is not a scientific meshod of describing the problem

to this day.

At least, if you take up the question of alcoholism in France as a whole, would it oot be proper to state what has been done to fight it? And measures have been taken: absinthe, perhaps the most dangerous of al-cohols, has been suppressed. Some weeks ago, the French government promulgated the law of the 1st October, 1917, on the repression of public drunkenness and police regulations concerning liquor selling establish-ments. Undoubtedly, there is yet much to be done; but France is a country of great com-monsense and "nearly one-half of the active adult male population of France" is not adult male population of France" is not "vitally interested in the liquor business" in

Spite of your assertions.

Since forty months, the "active adult male population of France" has proven, has it not, that it has other interests at heart than the "liquor business"? It is unquestionable, al-so, that the French soldier is not overcome by alcoholism. The trush is that never has he been so well protected against it, and it rests with the American authorities for your troops to be still better protected. Therefore, why this complacency to paint under such desperate colors the defects of "gallant France" and to exaggerate the risks which your boys will run by her side?

Believe me. Sincerely yours,

Pour I.e Haut Commissaire de la Republique française aux Stats Unis Le Déléaue Général.

Enguage or Bully.

Washington.

To M. EDOUARD DE BILLY: I feel greatly indebted to you for your letter. I hope from now on you will allow us to come to you for advice and help and to clear up misunderstandings-such a misuoderstanding as arose between us because we mean something quite different by the word alcohol. When we in America say alcohol we mean any beverage that contains alcohol—beer, wine or distilled liquor. Wheo you say it, you mean distilled liquors only. To say that your troops have no alcoholic beverages means to you that they have no spirits; to us that they have no beer, wines, fermented ciders or spirits. Now will you please let me explain to you

precisely why I wrote that particular article? You cannot conceive the ignorance here about There are people who, because France is so far away or because while they were there for a week or two they did not happen to see a man intoxicated, believe that France never drinks distilled liquors, only wines, and that no one gets drunk or even fuddled on wines.
You and I know this is not true, but I

felt our people must learn first that France has a grave drink problem; second, that it nas a grave drink problem; second, that it comes, according to your own confession, both from distilled liquor and from wines, even light wine if one takes enough of it. Lieutenant-Colonel Paul Azan, a French officer, has told me how often his men were drunk on light wines alone because when they began they took so much of them. And again, you know, men do not have to be quite drunk to have their self-control loosened; small quantities of beer and wine do that, and the result is an unnecessary amount of that disease which is a greater foe than Germany. Of course, were there no water to be had, the troops might have to have wines doled out to them by the officers, but that is different from giving our troops carte blanche to drink.

Well, when the people here understood that France has a drink problem and that our men when not in the first or second-line trenches-where they would be carefully guarded, of course-would have to be with the civilian population, living in their houses, as there is no lumber to build separate bar-racks—then I wanted them to consider what we could do. I wanted them to know that there was a real movement against alcohol in France and that we could turn to that.

There was our hope.
Since I wrote, the French government has offered to cooperate in any way that it can to help our troops, but you point out that Is Yours a Popular Organization!

unless our government asks for protection for our troops the French government can do little. I was trying to say just what you say
—that it is for us to act. But, you see, it is -that it is for us to act. But, you see, it is so new to us all. The War Department has had to grope its way along-up to now, at least up to the last reports that have reached me from the French press, our troops are forbidden to drink anything over 18 per cent alcohol. In short, if I am correctly informed, over here it is total abstinence, over there temperance. But, please understand, this is not the fault of the French; this has to do with our government, feeling its way along under new conditions.

I believe that the President of the United States should explain about wines to our troops, and ask them to be what the big doctor's unit from Boston decided to be while abroad-total abstainers. Once he did this, Colonel Azan tells me the French people would cease in a spirit of hospitality to urge drink on our soldiers, because of their love of military obedience, and the mayors of the towns would hasten to close the saloons which sold to our uniforms. I may be wrong-for the problem is new to me-but I believe it would be as easy to enforce total abstinence as to enforce a law that punished men that drank over 18 per cent alcohol only.

I should like to know what you think. 1

understand that President Wilson and Secretary Baker are leaving the whole matter to the Committee on Training Camp Activities. These men do not pretend to be medical or alcohol experts. It seems to me the War Department should appoint an alcohol com-mission to frame a consistent alcohol policy. For medical knowledge they could turn to the general medical board of the medical section of the Council of National Defense. There we have twenty-five physicians, the eream of the profession. It seems to me if such a body could meet with you and Colonel Azan and other dignitaries from your country it would be of the greatest help.

I hope from now on you will allow me to consult you, for I can see that we both want the same thing-the best possible protection for our troops.

FLOZABETH TOTON

## **JOTTINGS**

UPON reports received from Isidore Hershfield, who for about a year represented the Hebrew Sheltering and Immigrant Aid Soeiety in Europe, Secretary of State Robert Lansing has instructed the American ambassador to Japan and the American consul at Yokohama to report upon the number and condition of Jewish war refugees stranded in Japan on their way from Russia to America. According to reports, hundreds of women and children, most of them from Russia, have been unable to proceed to our Pacific ports for lack of steamship facilities

IN the article Girls and Khaki in the SUR-VEY for December 1, extracts were given from the reports of a woman protective officer in an eastern city. Fictitious names were given for the real names of the girls who had been investigated by this officer. This fact was not stated, however, and it has been ealled to our attention that some readers coneluded that the identity of the girls was being revealed. This is not true, and the organization in question, as well as the SURVEY, makes it a policy not to reveal the identity of individuals under these eircum-

HEREAFTER the Board of Public Charities of North Carolina is to be styled the State Board of Charities and Public Welfare. It has effected also an enlargement of powers to provide for the placing and super-vision of dependent, delinquent and defective children; to ereate a new officer, the county superintendent of public welfare; and "to study the subjects of non-employment, povstudy the subjects of non-employment, pov-erty, vagraney, housing conditions, crime, public amusement, care and treatment of prisoners, divorce and wife desertion, the social evil and kindred subjects and their causes, treatment and prevention, and the prevention of any hurtful social condition."

AMBASSADOR SHARP recently eabled to the State Department on the sanitary condition of the camps of the American troops, situated in one of the most pieturesque sec tions of France, with natural drainage and good water. The new barracks are well ventilated, spleudidly located and of good ventilated, spieudaly located and or good construction. This agreeable picture is somewhat marred, however, by the forecast that in spite of good weather in the last few weeks, it will not be possible to complete the barracks and that "it will he necessary to house a considerable number of men in small towns and villages where the sleeping accommodations are not of the kind to which the men have been accustomed at home."

PLAYGROUND work in the Philippines is rapidly expanding under the leadership of Messrs, Elwood S. Brown and Fred England. of Manila. Although the system is less than a deeade old, the eurrent budget is more than 80,000 pesos. The Filipinos have few native games. Their play life is poor. They respond quiekly, however, to American leadership. The municipal system of Manila has now a staff of twenty workers with an at-tendance last year of 433,576. The first playground, Tondo, has been expanded into an evening center.

EDMOND BROWN, formerly instructor in government at the University of Missouri, been made executive secretary of the newly-created Charities and Correction Commission in Arkansas. The commission is a permanent body instructed "to inspect and examine into the condition and management of state, county, municipal and private institutions within the state for the eare of dependents, defectives and delinquents. Iulia Houston, formerly secretary of the Associated Charities of Pine Bluff, has been made field secretary.

THE December number of the Birth Control Review heralds the revival of that magazine. A note by the editors explains that, al-though the forward march of the birth con-trol movement was halted by the entry of this country into the European war, those who "started this agitation believe as strongly as we did in the beginning that birth control is the most fundamental issue before the American people today." Margaret Sanger, Walter Roberts and Cornelia Barns are the editors. Elizabeth Stuyvesant has resigned, to devote herself to woman suffrage, and Frederick A. Blossom is now identified with the Socialist Party and with the social work of the Rand School of Social Science, New York eity. The office of the magazine is at 104 Fifth avenue, New York eity.

KEEP ON KNITTING" is the advice of the American Red Cross to the women of the nation. In a statement issued recently, Har-vey D. Gibson, general manager, says that many women are asking whether this is a serviceable occupation. The statement declares that "sweaters and other knitted artieles are designed primarily for warmth; they eertainly are not ornamental." Therefore, it must follow, it says, that when there is an almost universal demand from soldiers and sailors for such articles, the demand is a real one. In the last few months the Red Cross has had to buy 550,000 sweaters, in addition to those made by its chapters. needs knitted articles for destitute civilian populations as well as for soldiers. Therefore, it urges all women who are knitting to continue

THE entire milk supply of Tacoma, Wash., will be pasteurized with the beginning of the new year. Of 3,800 gallous of milk coming into the eity daily, 2,000 already are pasteurized in the depots of three large milk distributing plants and one ice cream company. Pasteurization, according to Dr. R. A. Button, milk and meat inspector of the eity Health Department, will give the eity through its staff of inspectors a complete cheek on the milk brought into the eity, not otherwise securable

EDWARD T. DEVINE has resigned as director of the New York School of Philan-throny. His work as chief of the Red Cross Bureau of Refugees and Home Relief will keep him abroad indefinitely, probably for the duration of the war. He is succeeded by Porter R. Lee, who since 1912, has con-ducted the courses in family welfare at the Mr. Lee was graduated from Cor nell University in 1903. He began social work under Frederic Almy as assistant seeretary of the Buffalo Charity Organization Society, and later as associate secretary. In 1909 he left Buffalo to become general secretary of the Philadelphia Society for Organizing Charity, from which position he was called to the New York school. He is also national director of the Home Service Institutes of the American Red Cross, twenty-five of which are being conducted in different parts of the country. The New York School of Philanthropy has this year the largest class of second-year students in its history. Thirtyone persons are now taking the full two years' course. There are sixty first-year stu-dents, and the total number taking special courses is one hundred sixty-two. A new class will be started in February to help meet the demand for trained social workers in rehabilitation work abroad and in the increased social activities at home. school is affiliated with Columbia University, and is the department of philanthropic education of the Charity Organization S ciety of New York. It has an endowment of one million dollars.

#### THE SURVEY'S DIRECTORY OF SOCIAL AGENCIES

SHAVEY

ASSOCIATES

#### KEY

If you know the name of the agency or organization, turn direct to the listings (3d column) for address, corresponding officer, etc. [They are arranged alphabetically.]

If you seek an unknown source of information, turn to the subject index, following. The initialings correspond to capital letters in names of agencies.

If you want to know the agencies at work in any great field of social concern, turn also to this index. [They are grouped under major subject clas-aifications, as "HEALTH," printed in capitals.]

Correspondence is invited by the agencies listed; questions answered (enclose postage for reply) and pampblets supplied free or at nominal charges. Membership is not required of those seeking information, but offers an opportunity for you to share spiritedly and seriously in your com-munity or profession in an organized movement which is grappling with some country-wide need or cause.

If you are uncertain where to turn, address the SURVEY, and we shall en-deavor to get your inquiry into the right hands

#### WARTIME SERVICE

"HOW the Survey can serve" was the subject of an informal conference held early in April, in our library, to which we asked the executives of perhaps twenty national social service organizations. The conference was a unit in feeling that as a link between organized efforts, as a link between organized egoris, as a means for letting people throughout the country know promptly of needs and national programs—how, when and where they can count locally—the Survey was at the threshold of an opportunity for service such as has seldom come to an educational enter-

The development of this directory is one of several steps in carrying out this commission. The executives of these organizations will answer questions or offer counsel to individuals and local organizations in adjusting their work to emergent wartime demands.

Listings \$3 a month for card of five lines (in-eluding one listing in SUBJECT INDEX by full name and three by initials), fifty entat a month for each additional line. No contracts for less than three months. Additional charge of \$1 for each change of copy during three-month period.

#### WORK FOR A DRY ARMY

THE Poster Committee of the Unitarian Temperator ance Society, 25 Beacon Street, Boston, Mass., begs the public to post broadcast the above poster (5 given away free, 100 for \$1.25). Congress will act, if the people ask. France, also, has officially announced her readiness to cooperate in any way. But the United States must first forbid its troops to buy or receive any alcoholic drinks and must then ask France for dry zones in which this total abstinence ideal may have a chance to thrive. Please act! Time presses! Every poster posted helps to increase efficiency and decrease the social disease more deadly to armies than shrapnel.

12 W. Mt. Morris Park NEW YORK CITY

In Presenting a brief announcement of some of the books which we publish, we do so in the firm conviction that each book mentioned on this page fills a niche of its own, stands for something distinct and definite. There is not one rehab book among them; not one of them is a complation of platfuldinous commonplaces; each book is truly original, either in its subject matter or in the manner of presentation. And each book will give the reader valuable information or at least precious food for thought. It is admitted that as thought-stimulants our books have no equals. Each book is truly order the only one of its kind or the best of its kind.

Price, \$1.00

#### The Limitation of Offspring

By the Prevention of Conception BY WILLIAM J. ROBINSON, M.D.

WITH AN INTRODUCTION BY A. JACOBI, M.D., LLD., EX-PRESIDENT OF THE AMERICAN MEDICAL ASSOCIATION

All the arguments for and against the voluntary limitation of offspring, or birth control, concentrated in one book of 250

Doctor Robinson gives the problem a clear, unvarnished, and thoroughgoing treatment. He pitches into the social and medical implications of the prevention of conception, furnishes the practice with a scientific basis, exposes the diabolic character of the law that suppresses contraceptive information, and gives the bugaboos supporting the law no quarter. The book punctures every objection to birth control that credulity and stupidity have been able to advance.-The New Republic.

Woman: Her Sex and Love Life

For Men and Women

By WILLIAM J. ROBINSON, M.D. ILLUSTRATED

This is one of the most important, most useful books that we have ever brought out. It is not devoted to abstruse dis-cussions or doubtful theories: it is full of practical information of vital importance to every woman and through her to every man, to every wife and through her to every husband. Price, \$3.00

#### Sexual Problems of To-day

By WILLIAM J. ROBINSON, M.D. A few of the subjects which the author discusses in trenchant fashion are:

The Relation Between the Sexes and Man's Inhumanity to Woman.—The Influence of Abstinence on Man's Sexual Health and Sexual Power.—The Double Standard of Moral-ity and the Effect of Continence on Each Sex.—The Limitation of Offspring: the Most Important Immediate Step for the Betterment of the Human Race, from an Economic and Eugenic Standpoint.—What to do with the Prostitute and How to Abolish Venereal Disease.—The Question of Abortion Con-sidered in its Ethical and Social Aspects.—Torturing the Wife when the Husband is at Fault.—Influence of the Prostate on Man's Mental Condition .- The Most Efficient Venereal Prophylactics, etc., etc.

"Sexual Problems of To-day" will give most of its readers information they never possessed before and ideas they never had before. Price, \$2.00

#### NEVER-TOLD TALES

Graphic Stories of the Disastrous Results of Sexual Ignorance By WILLIAM J. ROBINSON, M.D.

The stories told in this book burn deeply into the heart and mind, and not even the most impassive will be left cold by them. For these tales, direct and terse in narration, will grip the reader by their soul-stirring and thought-compelling ap-peal; and it is certain that the book once taken up will not be put down until the last line has been read.—The FIRST and still the only one of its kind. Price, \$1.00

#### EUGENICS and MARRIAGE Practical Eugenics

By WILLIAM J. ROBINSON, M.D. A Popular Favorite.

Sex Knowledge for Boys and Men By WILLIAM J. ROBINSON, M.D.

An honest, unbiased, truthful, strictly scientific and up-todate book, dealing with the anatomy and physiology of the tion, and the manifestations of the sex instinct in boys and

Absolutely free from any cant, hypocrisy, falsehood, exag-geration, compromise, or any attempt to conciliate the stupid or ignorant. Price, \$2.00

#### SMALL OR LARGE FAMILIES Birth Control from the Moral, Racial and Eugenic Stand

By C. V. DRYSDALE, HAVELOCK ELLIS, WILLIAM J. ROBINSON and PROF. A. GROTJAHN Price, \$1.00

#### UNCONTROLLED BREEDING Or Fecundity versus Civilization

A Contribution to the Study of Over-Population as the Cause of War and the Chief Obstacle to the Emancipation of Women. Price, \$1.00

Surary Associarta, Isc., is an adventure in cooperative journalism, incorporated under the laws of the state of New York, Norember, 1912, as a membership organization without shares or steckholders. Membership is open to readers who become contributors of \$10 or more a year. It is this widespread, convinced backing and personal interest which has made the Surary a living thing.

convinced backing and personal interest which has made the SUNEY a living thing. The SUNEY is a weekly journal of constructive pathanthrops, founded in the 90% by the Charity Organization Society of the City of New York. The first weekly issue of each month appears as an enlarged managine number.

From the start, the magazine and its related activities have been broadly conceived as an educational enterprise, to be employed and developed beyond the limits of advertising and commercial receipts.

Some Little Known Conditions of Child Life in South America

By Edward N. Clopper

NATIONAL CHILD LABOR COMMITTEE

OCIAL workers in Latin-America hope that the second Pan-American Congress on Child Welfare, to be held in Montevideo next March, may, by revealing our community of interest in welfare work, provide the touch that will make the Americas kin. An earnest effort is being made to have this congress serve as the medium, herefore lacking, for bringing together in spirit at least, all those of the two continents who are concerned for the welfare of children. President Viera of Uruguay has placed the congress under the patronage of the national government and invited the twenty other countries of the western hemisphere to participate.

Not many of us here in the North realize the extent to which, in the struggle toward better things, North, Central and South America are confronted by the same problems and grapple with them in much the same way. We read, for example, of the wretched work and long hours of women and children in homes and sweatshops in this country without thinking that the sisters of these women in Argentina and Chile, Brazil and Uruguay may be doing very much the same work in their own homes under conditions of exploitation very similar. Here is a description of artificial flower-making written by Carolina Muzilli, formerly a factory inspector of Argentina, who has prepared elaborate data on the conditions of working women in South America. The place is Buenos Aires:

"The manufacture of artificial flowers is one of the industries which seem to have been created especially for women. The beautiful blossoms that come from their hands imitate to perfection those created by nature, and the raw material paper, cloth or silk—rapidly changes into delicate buds and leaves. The making of cloth and paper flowers may involve no greater danger to health than that attending an excessive workday, but when the material used is wax there is grave menace to the health of the workers. Do the happy brides who encircle their locks with the traditional orange blossoms ever think how many tears, how many long vigils, how much suffering are held in each one of these little white flowers? Do they think, perchance, that the hands which fashioned them as a symbol of their own purity have the same deadly which as the orange blossoms themselves? Do they ever think that tribute is paid to their happiness in the form of anæmia and tuberculosis which make victims of the poor workers who send their day modeling this symbolic flower?"

These women labor nine and ten hours daily in wretched homes and receive from sixty cents to a dollar in our money. After remarking that one of Argentina's labor laws "strictly prohibits the employment of women in industries which endanger their health," Miss Muzilli draws a familiar picture of her efforts to enforce this law:

"The flower-makers who manufacture the orange blossoms are constantly breathing the fumes of melted wax and their faces, without any exaggeration, reflect its own deathly pallor. After I had made complaint, the national labor department inspected some of the flower workshops, found grave violation of the law and fined several houses, but the wax flowers, in spite of the assurance of employers that they are imported from Paris, continue to be made here. To show how the laws affecting working women are observed, according to official data. I reproduce the note sent by an inspector of workshops and factories after having visited several flower workshops as a result of the complaints submitted. He says: 'Following the instructions received, I inspected the artificial flower factory which Messrs. Buett & Niorggi have in Charcas street. The hygienic conditions under which the work is carried on there could not be worse. In a little room there work ordinarily from eighteen to twenty females, both adults and children, breathing air that is extremely unhealthful on account of the poisonous fumes and paints used for coloring the flowers. There is no register of employes kept and besides there were found six children working illegally."

"Such are the thorns in the pretty flowers that adorn the foreheads of the brides!"

Recognizing that the work permit issued to boys and girls who leave school to enter industry is the basis for the enforcement of a child labor law, the national department of labor of the Argentine has prepared and put in use a form which is in some respects an improvement over any used in our own country. It is not a card but a booklet and contains a description of the bearer with his name and address, his certificate of age, his record at school, his certificate of physical fitness and the signature of the official granting the permit. On the last few pages is printed the law governing the employment of minors. Its most unique feature, however, is a record of all the positions held by the bearer, with the dates, names of employers, character of service rendered, wages earned and other information. This enables anyone easily to ascertain the industrial history of every child who has been employed at any time and facilitates the composition of important statistics.

#### Progressive Social Practice

URUGUAY is one of the most progressive countries in the western hemisphere. Many of the reforms so ardently advocated elsewhere have already been realized here. For example, the eight-hour work-day for adults is an accomplished fact. In the field of education, only 4 per cent of the scholastic population is illiterate. There are at present about one thousand schools in this country with an enrolment of approximately one hundred thousand. The entire population of the republic is a little more than a million and a quarter. It is interesting that there are more than five times as many school mistresses as school masters, revealing the same tendency for women to supplant men in the educational world as is found in northern countries. Children of both sexes from all social classes are admitted to the public schools and the country takes great pride in this evidence of its democratic government. Since 1909, all religious teaching and practice have been abolished in the public schools. Almost half of the population live in rural districts where there is a school for every thirty or more children and where teacherages are built for instructors' homes. The compulsory education law applies to all boys residing within four kilometers of the nearest school and to all girls who live within two kilometers. If the attendance exceeds sixty, an assistant is furnished. Married as well as single teachers are eligible for service, in which respect the school administration of Uruguay is more liberal than some of our North American boards.

The interference of agricultural work with attendance at rural schools is quite as marked in Uruguay as it is here, for as soon as the child is able to perform labor on the farm and the compulsory attendance law permits, he is taken out of school and put to work.

In the normal schools, during the first four years of study, the pupil enjoys a pension of fifteen dollars a month, granted by the state to help defray living expenses on condition that he teach where assigned to duty. For more than twenty years teachers have enjoyed a pension upon retirement which amounts to full salary if the service has extended over a period of twenty-five years. Those unable to continue in the profession may retire on a pension after ten years of service. Retired school masters may transfer their pensions to their widows or children.

Medical school inspection has been highly developed and embraces not only examination and vaccination of pupils but also of teachers. The service includes, also, the approval of school building construction to insure proper situation, ventilation, water supply and drainage. It extends also to the choice of school furniture and supplies so as to prevent the use of material prejudicial to health or likely to develop deformities. School programs are subject to the approval of the medical inspectors to insure proper proporation of study and

rest and opportunity for physical culture and manual work. The municipal council of Bogotá, the capital of Colombia, recently provided for medical school inspection in charge of three physicians. Among their duties is the examination at least once a year of every pupil in the primary schools, the keeping of records of such examinations and the recommenda-

tion of measures to promote hygienic conditions.

The most effective child welfare work carried on in Chile is that of El Patronato de la Infancia, whose headquarters is in the capital, Santiago. The society was organized to combat infant mortality about sixteen years ago, when of 18,300 deaths in the city 11,401 were of children—two-thirds of the total. The society maintains several distinct kinds of service:

The gotas de Îrche, which are really free dispensaries, popularize, in a practical way, the principles of infant hygiene and reduce the infant mortality rate by the encouragement of natural nursing. Where the latter is impossible, the dispensaries supervise the artificial feeding of the children. Only babies under one year of age are cared for at these dispensaries.

El ailo maternal receives mothers with new-born children and cares for them during the period of convalescence, attempting in this way to care for the health of the mother untilshe is able to return to work and to insure natural nursing, at the same time imparting knowledge of child hygiene and stimulating the development of moral ties between the mother and the child so as to reduce the number of desertions which had arisen to distressing proportions among the poor and ignorant classes. In this asylum the society does not reveive orphans and only occasionally, under special circumstances, does it accept a child without is mother.

El ejuar infantil collects and distributes articles of clothing for the beneficiaries of the society, ranging in number from two hundred to one thousand persons, depending upon the season of the year.

El consultorio maternal gives prenatal care and obtains for prospective mothers leave of absence so as to insure employment following the period of confinement. If necessary, financial aid is extended during this period.

#### The Infant Death-Rate Cut Down

THE results of the society's work may be summarized as follows: Formerly from 34 to 39 per cent of the babies of the city died before reaching the age of one year while now, among the thousands of cases reached by this society, whose work is with the poorest and most ignorant classes, the infrat mortality rate has been reduced to only 8.4 per cent. This service cost last year a little more than 170,000 perso of which the national government contributed 70,000 perso of which the national government contributed 70,000 perso, the remainder having been obtained through popular subscription. Branches have already been established in several of the chief cities of the provinces.

In Uruguay there is an aggressive movement on the part of women for social welfare. A few months ago the national council of women was organized in Montevideo and a monthly periodical is published under the title of Accion Femenina. This council is affiliated with the International Council of Women, which has branches in many countries. The crganization in Uruguay has committees on education, relief, hygication, indict, publication have been devoted to woman suffrage and anti-tuberculosis work. The president is Dr. Paulina Luisi, who is prominently connected with the medical profession in Montevideo, a moving spirit in medical school inspection and one of the leaders in the Paa-American Conpress on Child Welfare.

# Gretchen of Hildesheim

# The American Playground Prescribed as an Antidote to German Militarism

By C. M. Goethe

HANTI was a hill woman on that roof of all the world-Nepal of the Himalayas. She was climbing the rock-strewn trail. The play of her muscles told of a girlhood spent, goat-like, among dizzy crags, among gale-swept rocky needles, piercing the blue high above that battleline where the dwarfed deodars, fighting the avalanches, persistently tried to push the timber line upward. Khanti seemed as knotted-as elastic-as those occasional dwarf trees scattered along the trail, which trees, like her, had been buffeted, hammered by winter gales. Her dress was of simple mountain homespun, dyed with native colorings, won from barks, roots, berries. Her golden ornaments were the nose ring, the nose side-disc, the bulky ear-discs of her race. Her tribeswomen carried their babes a-hip. Hers -the first born-was in her arms. This betrayed the child's illness. From the summit she was seen to stop at the little monastery not far below. She nervously spun the hand prayer-wheel at its entrance, then knocked. A shaven-headed Buddhist priest responded. His manner showed that she had given more than the usual fee. From beside the saffron robe a bare arm moved quickly to shift the sluice, whose spouting water revolved a second prayer-wheel-a water power onewhich also repeated that eternal prayer of the Buddhist: "Om Mani Padme Om."

Buddhism is an excresence covering the nature worship of these hill folk. Under the stimulus of its primal prompting, Khanti next hurried to the leafless sacred tree on the storm-blasted summit. She laid the child tenderly in a sheltered nook behind a huge rock. Then she nervously added another to the tree's hundreds of fluttering cotton strips, each marked with India ink Chinese word-signs. Khanti's brush-stroked characters constituted a prayer for the return of her babe's health. Each flap of the rag in the wind would mechanically repeat the appeal to the lotus-enshrined Prince of Peace. Something of his own calm expression came into her face. The look of anguish seemed to pass. With a glance of wordrous mother love, she turned to her first-born.

A German, von der Haide, wasched Khanti. An officer in the artillery, of fine physique, straight as an arrow, tall, broadshouldered, he was still young. His trim form showed not an ounce of that waste fat that often, in later, over-feeding years disfigures his type. Blue-eyed, golden-haired, rosy-cheeked, he was a magnificent specimen of that fine old Hanover stock that had been keet racially oure.

His companion was also interested in the scene beneath the sacred tree. Speaking of the apparent satisfaction that had come to Khanti, the latter quoted Kipling's lines about the idol at Kamakura: "Be gentle when the heathen pray."

The German's face hardened. "All religion is nonsense," he impatiently exclaimed. "My materialism teaches that Christianity, its rosaries, its conception of a virgin, is borrowed from these superstitious orientals. Learning to ignore religion, I enjoy life, indulge my every sense to its uttermost." Buttoning his coat as the evening's chill wind increased its

force, he continued: "You Americans shut your eyes to these facts; therefore, you are decadent."

It was a striking contrast. At that moment, Khanti, her face glorified like a Madonna's as she bent over her wee bairn, seemed to be the very personification of the patient, the long-suffering East. The young German artillerist, born of a folk that not many decades ago had bitterly fought the Prussians, seemed, in just as sharp-cut relief, to represent the latter's Kultur. He had been chatting of this Kultur shortly before Khanti's coming. His later outburst against all religion showed, with illuminating clarity, how thoroughly a certain group in Germany had moulded in plastic childhood the minds of even those whose almost immediate ancestors had opposed lunkerism.

The von der Haide militaristic-commercialistic-materialistic type is proportionately far more numerous among the Germans in the Orient than in the Fatherland. In Germany their numbers are diluted. In the Far East the tourist comes into contact with naked von Bernardi-ism: Observing the contact of such men with the darker-skinned races of the East, there came to mind questions that troubled. Here, from our western civilization, was a highly developed type. More than merely undesirable, it seemed a positive menace. In a world study of adults as products moulded by childhood play, the question naturally arose how such a type was produced The determination came again to visit Germany, to go to Hanover, to von der Haide's purpled heaths, to study his wee brothers and sisters at play—to fathom, if possible, this mystery—to learn whether German militarism extended to her children's play.

The decisive time in fixing such life habits as seemed to control every reaction of von der Haide, is youth. Recognizing this, an endeavor was made to search for the cause of such an attitude as his—to comprehend, if possible, how a civilized nation should produce, so frequently among its most promising sons, the type that seemed to sneer at all who lived beyond the Fatherland's borders, from their own European neighbors to the folk of the Orient; to jeer, even within their national confines, at things other men deemed sacred. Two visits to Germany were made. When, one morning in July, 1914, nobilization notices sprang up, mushroom-like, everywhere overnight, a third visit was nearing conclusion.

These pilgrimages resulted in convictions. Germany was wonderfully efficient in much of her recreation. America might learn much from her. When American playground workers establish their international clearing house for recreation, America will draw greatly from German sources. We might well study their Wandervögeling, their nature-study-field-excursion, their municipal theater and opera house, their labor union night at the latter, their Kleingartemverries.

Automobile-loving, non-walking America could profitably adopt Wandervögeling. These organized hikers, these "wandering birds" of the Fatherland, have apparently during their evolution become wingless. Their activity, however, is indi-

Dhilled a Google

GARDEN PLOTS AT A FACTORY

cated by knotted leg muscles. No wandering Bedouin of the Atlas rock desert need be ashamed were these muscles his. These Wandervögel, descendants of the sturdy race that produced the meistersingers, are musical birds, too. Companion to the Rucktack, or back-knapsack, is guitar or mandolin slung a-shoulder. They will barter a song for an evening meal as David Grayson might trade the hoeing of a row of companion.

Fall into step with one on the Axenstrasse, with the giant of Uri looming above the blue waters of the Four-forest-cantons Lake. He seems to live the Andalusian's "today is the great day." You swap experiences, such as can be exchanged only with the long-distance tramp. Then he points to a pine tree's shadow, for a rest. In the welcome shade he opens the door to his soul.

Then you learn that, even in this outdoor sport, the good has been perverted by Hohenzollernism. Somebody "higher up" long since grasped that national love of hiking meant seasoned soldiers. Even the mountain sunlight has not been enough to illuminate the dark corners of our Wandervogel's underlying pessimism. His apparent joy only intensifies the shadows. The saddest result of Hohenzollern philosophy is the hopelessness of this pessimism. The war-word, Kanonenfutter-cannon-fodder, that your Wandervogel friend uses, is this pessimism crystallized. The state may win its future "place in the sun." For the individual, this Wandervogel companion of your alpine tramps, there can only be the leaden heaviness of the coming war burden, beside which his wellfilled Rucksack is as light as a feather. From this inwardly pessimistic Wandervogel came a first tangible indication, deepened by all the events of the war, that German militarism has extended to her people's play; that the saner, post-bellum Germany will need the democratizing influence of the American playground.

Germany's nature-study-field-excursion also deserves American study. You go to Ulm, the efficient, whose city-owned land exceeds in area the holdings of all its individuals. Almost under the shadow of that great medieval monument of community effort, the slender spire of Ulm's graceful

Gothic cathedral, another German, your table companion, breaks his anemic Zuckerbrot. He is a manufacturer. He talks entertainingly of rifles smuggled up the blistering reaches of the Persian Gulf, or into the swampy morasses of revolution-cursed Caribbean states. From rifles you divert the talk to recreation. He matches the German nature-study-field-excursion against the American playground. Your curiosity aroused, that week-end you take the field with a dozen and a half young Teutons. They are studying fungi. They swing with the hiker's step. After four miles the woodland is reached. Their sharp eyes find a species for which you have vainly searched for years. The spirit of the hunt—the spirit of the explorer, enters into the quest. The musically sonorous Wanderlust of their native tongue rings with new meaning in your ears.

Something, however, above all narrows in your attention. It is the minute thoroughness of the black-eyed Swabian, their teacher. You commence to understand the German patience that can mathematically measure the resistance of a stalk of rye weighted with a windblown ripening head. This excursion might have been recreation. It is in reality business. Then comes again that appalling thought: The good is perverted by Hohenzollernism.

The manufacturer, breaking his Zuckerbrat, boasted that markets won by the efficiency of his workmen had beginnings traceable to bright eyes trained in observation on the nature-study-field-excursion. The inquisitive instinct that makes the lad risk a slender bough to see what is happening in a bull-finch's nest—even this is skilfully utilized by the psychologically wise munitions manufacturer, whose toast has ever been to "The Day." You remember the Chicago stockyards story—everything of the pig saved except his squeal. This German militaristic-commercialistic-materialist, transplanted to Butchertown, would probably have found some use for even the porker's diving cry.

How have his kind directed the nature-study-field-excursion toward making Germany a great producer of scientific thinkers? A yellow-haired, blue-eyed boy chases butterflies on the heather purpled Hanover heath of von der Haide. Twenty-

GRETCHEN OF HILDESHEIM

five years later this same child has become a young scientist. Far into the night he works, earnestly, with poisonous gases, that men in mines, in chemical factories might control their occupational diseases. Finally Hohenzollernism turns from his original purpose all his achievements in poisonous gases. His life work is prostituted to the great war god. Reading of liquid fire, of clouds of poisonous gases, one goes back to the little child whose first scientific leanings came in chasing butterflies along wild roses hedges. Even children's recreation may be turned to the service of Mars.

Let America consider labor union opera night. Dresden's season is at its height. An old favorite is to be sung five nights hence. Even this early, you cannot obtain a ticket. It is Volksvorstellung, "trades union night." Having no union standing, you are hopelessly barred. Your participation in that night's festivities is as spectator near the opera house entrance. You study the long files of operatives and their families, streaming into the building. The glimpse into the corridor seems a peep into Utopia. Your brain surges with theories carefully thought out during two decades. Often you have wondered in American cities whether downtown wards would pile up those majorities that bulwark the mirrored saloon and the red-lighted brothel if the slum folk, too, had free access to good music, good pictures, abundance of fresh air, sunlight. No Dresden slum folk were to be found. Its operatives, though dependent on the daily wage, enjoyed art's best. In the Bildergallerie, groups of them were continually bringing their children to learn to know the Sistine Madonna. They contentedly drank in the music at the Grossergarten concerts. This city, old outpost of Charlemagne's empire, pioneered in city-planning art. Now, in a steady stream, were these mechanics, who could enjoy all art, coming to a feast of grand opera. This had been made financially possible because The State was interested in their welfare.

Watching the crowd, there came memories of how California had borrowed from Germany its workmen's compensation. The workmen's insurance against old age, against ill-

GRETCHEN'S BROTHER WITH HIS "RUCKSACK"

A GARDENER AND HIS SHELTER

ness, of which California talked, had long been an actuality in Saxony. Here was a nation free of vagrants, with cities of great model tenements. Here were municipal fire insurance, municipal forests, city-owned abattoirs. These workmen came to their opera over municipal car lines that eliminated bribedispensing directors. As you watch them, you recall studies of Frankfort's commanding the services of the burgomaster who made Osthafen possible. In America he would have been a realty operator, stuffing into overladen safe deposit vaults his "clean-up" from unearned increment. Cityplanning here can peer into the twenty-first century. These contented factory hands had probably spent Sunday raising sauerkraut material or roses in their Kleingartenvertrieb, or individual suburban summer gardens for factory folk, another of Germany's best recreational successes, these often adjoining the factory itself. Before you still passes that line of cabinetand porcelain-makers, tailors, carpenters, into the governmentowned opera house. You say "Yes, here is Utopia."

Pacing the homeward-bound steamer's deck, you learn why contented workmen are necessary for Hohenzollerinsin's far-reaching plans. Subsequently you meet one, ten, three-score von der Haides. Later, under the Southern Cross, one of these officers even lends you his copy of von Bernardi, to convince you of Germany's need of a "place in the sun." Here is that which takes the time necessary to calculate the value to its war-and-commerce machine, of leg muscles hardened by systematic Wandervögeling, eyes trained to keenness on nature-study-field-excursions, souls made contented in Kleingertensertrich, and by music on trades union opera nights, and by music on trades union opera nights.

Then in your mental picture there comes to the side of von der Haide, snering at the praying of Khanti, the figure of a little girl, Gretchen of Hildesheim. Like von der Haide, she, too, was golden of hair, pink of cheek, blue of eye, desended from that same finest of the world's race strains. The country around her home is a wonderland. The active imaginations of her ancestors had peopled its nearby blue hills with wood nymphs and butterfly-winged fairies. In yet older days, their forefathers had named their forest gods with title that still persist, even among the weekday names of their

descendants that have strayed far to our America. The Woden of these fur-clad forest warriors rules in Wodensday, our Wednesday, their Thor hammers in our Thursday.

In Gretchen's home city, built in this land of fairies, of sylvan gods, a further study was made of this wonderful efficiency of the Germans. Here again, behind the dazzling brilliance of their success, seemed to be that which was, indeed, gloomy and threatening. School children's play was found to be part of the great military-commercial machine. Gretchen was a cog in it. She was asked to stop a moment for a photograph of her Rucknack. At the request she was immediately as immovable as one of Friedrich Wilhelm's tall grenadiers. There was no curiosity, no turning of the head to see what was happening behind. Gretchen remained as if petrified until told she might go. Conceive the average American child standing at attention like Gretchen. Occasionally one might be found. Generally the eyes in little heads would be eager to know what is happening behind.

Gretchen's behavior might have been merely an incident. It was an incident repeated, however, only too may times and in widely separated parts of Germany. She was one of many German children encountered who, even in tender years, seemed to have learned dumb obedience. Every natural movement of curiosity seemed repressed. Laden with its few books, Gretchen's Ruekuck seemed pathetically to cry out, "Already part of the war machine, I am branded with Kultur's K. K. K."

Then, from questions to elders, came guarded confirmations that the highly centralized military-socialism which dominates the German government did, indeed, extend not only to press, to university, but to the school and to play-time. As of Herr Lazarus, author of The Human Slaughterhouse, they told of forceful urban teachers, holding views opposed to Junkersim's military policy, quietly marooned in unimportant rural schools. Any schoolmaster, university professor loud in its praise, was advanced.

This is why there is here offered for the reader's criticism, the thesis that German militarism extends to her children's play, that to remove its withering effect, the saner, postbellum Germany needs the democratizing influence of the American playground.

Gretchen, her brothers, her sisters, all the docile school folk of Germany, seemed the childhood beginning of a system that resulted in that which made possible von der Haide's cynical outburst. In Khanti's country, men were peering with shaded yet expectant eyes, toward the lands nearer the setting sun. Were they to be disappointed? In the center of that western civilization for which they hungered was the land of von der Haide, yet here liberalism, democracy, freedom of speech, of press—yes, even the joyous spontaneity of childhood—was blasted by the ruthless militaristic philosophy of the men in control.

The extent to which such demoralization of the free play of children may influence their adult life is probably not yet fully grasped by most of us. Certain leaders in thought, like Jung and Foch, have reached some startling conclusions. Among them is this: The cause of either hysteria or extreme nervousness in adult life may lie in such apparently unimportant beginnings as a child's witnessing scenes of friction between quarreling parents. If such discord can produce a decade or two later, pathological conditions—if Luther Burbank is justified in his assertion that the mind of a little child is many times more sensitive than the most rapid photographic plate, is not the German liberal justified in asking: What end seeks the philosophy of this Kullur? Should, because of it,

the education, the play of plastic-minded children, be thus coldbloodedly controlled to make them in after life merely-greater producers in peace, better warriors in war?

Since Sedan, the Germany that evolved this Kultur has been a laboratory upon an immense scale. In puny laboratories within walls we study problems presented by the colored lines of a spectroscope. We work out the life history of a wasp. Germany is a great unwalled laboratory. In it, controlling her destinies, a few have experimented with this unit of tens of millions of human beings. These have been unmindful of the warning sounded by such thinkers as their own Professor Paulsen of the University of Berlin. They have continued these experiments ever since those days, almost a half century ago, when great masses of their countrymen, singing Die Wacht am Rhein, went to the charge at Sedan. Germany's leaders, strongly materialistic in their outlook upon the world, have dared experiment with the most precious forces in life itself in attempting to weld these millions of human souls into a single commerce-and-war machine, a dynamo of energy. These leaders have manipulated the play of two generations of children. They know the wisdom of the Jesuit proverb, "Give us a child until he is seven. You may have him thereafter."

During this half century, the German military caste molded the national environment of a patient folk, adults, adolescents, children. They had at command practically all Germann's scientists. In today's second generation, some of these very scientists are those whose mature years have been preceded by such controlled years of childhood.

One oriental power follows Germany's lead. In her case, for example, school excursions are systematically made to shrines where the ancient dynastic religious objects share places of honor with new-won trophies from enemy battleships. Each destroying shell-scar is carefully explained to eagerly receptive minds. This power's school leaders have said. "Germany is our model," They are influenced by that Germany which found time to decree that little girls' dolls shall be yellow-haired instead of black. These dolls were made part of that nationalistic ideal necessary for war. Shrewdly the pan-Germanist went back to the old love of family, upon which was built love of clan, love of dukedom, love of nation. These primitive instincts were skilfully utilized as the basis of a patriotism demanding the clearest eye, the most active brain for the day when one machine gun was to be worth a whole regiment of the men of the days of Sedan.

Like her European prototype, this oriental power may come to know that such education is dangerous, especially when coupled with histories magnifying a country's military exploits at the expense of things accomplished in a non-military way. To Germany has come the bitter lesson that the end of such philosophy must be a far-extending coalition against any aggressor dominated by such thought,

At this writing no one knows how the war will terminate. It may mean the triumph of the German militaristic philosopher. There may, however, emerge from the conflict a different Germany. The Fatherland may find that it must laboriously, toilfully, patiently undo much of the results of these nearly fifty years of experiment in their gigantic laboratory. If, in shaping future national policies, Germany's liberals become the dominant factor, they will undoubtedly liberate childhood. If princes of the royal house remain, they will not have their play limited to models of submarines and dreadnaughts. The recreation time of school children of the masses will not be largely directed to military games. Germany will learn anew the power of suggestion that lurks in

SCHOOL children of Hildscheim on a "hike" with their teacher. They are shown here in the morning studying mediceral architecture. In the afternoon they go into the country for nature study. This part of Germany's recreation system is bring adopted in California under Mr. Goethe's direction.

play. She will comprehend that with such play, controlled by militaristic philosophers, it is inevitable that there will follow in adult life bloody scenes, men jabbing, stabbing, thrusting, cutting, mashing their fellow human-beings. If plastic child minds are thus moulded, a nation must, in manhood, expect war, with liquid fire more fiendish than any bit of hell that Dante imagined. It will freshly grasp that, under the law of cause and effect, such a nation must expect to witness such scenes as 4,000 of its picked sons going into battle, with twenty-seven hours afterwards all killed but 733.

In the years which follow peace, Germany, as well as the

rest of the world, will learn by whom the war was really commenced, whether its object was defense or conquest, whether this German militaristic propaganda has itself been as much a consequence as a cause—a thing fostered by Germany's position in the center of a Europe still given over to secret diplomacy, to armed camps and nationalistic ambitions; a system which Germany, by going furthest, only reveals in all its frightfulness. The German people may decide that, just as her kings of old looked with longing eyes on the vine-clad hillsides of sunny Italy, so another war lord may have similarly yearned for the warm lands, for stretching of his empire from a conquered Antwerp to a blistering Bagdad. Germany may generally come to believe what many of her liberals assert, that it is eventually all but fatal to a national safety to allow a small handful of men to dominate not only press and school system from kindergarten to university, but even the character-molding play of children, that so are manufactured crushed little Gretchens, cynical von der Haides.

Should the above theory be well grounded, may not our German liberal friends as themselves whether of all the countries in the world Germany, more than any other, does not need as type and instrument of a new scheme of adult life, what we call the American playground, adapted and changed, of course, to conform with her people's own peculiar needs. Will they not see that it is instinct with child relationships needed in their new society, that is caste-obliterating, stands for honesty, which would not tolerate Machiavelian diplomacy; extends this honesty to fair play in team work? If Germany's outlook upon the future is to be through something other than an officer's binoculars, if the trend shall be toward democracy, then can in any other way the transformation from the military caste system be made more surely and organically than through a renaissance of free play?

The American playground utilizes methods which, American in daring, in resourceful inventiveness, are yet almost German in their efficiency. In combating their country's caste-bound thought. German liberals may well turn to methods which are the outgrowth of our peculiar environment and heredity. In America has occurred a crossing of finest types. From Germany as well as from other European states, during many decades we have drawn from the best blood. The men who came were largely like those revolutionists of the 40's. who forsook the Fatherland to break with tyranny. They were men, instinctively pacifist, who sought to avoid military service. Even up to the late eighties many who came here were those who wanted the privilege of their own religious thoughts. These strains intermarried with descendants of those younger sons of the English aristocracy who formed the backbone of our South, of stern Puritans on the rocky New England Coast, of Huguenots, of Quakers.

Sons and grandsons of this blending have successfully attacked many problems. They have made America synonymous with mechanical invention. They have given this present war, for example, almost every widely used device from submarine to machine gun. The caterpillar, basis of the English "tank," should be credited to a German-American firm. Teuton patience has thus been crossed with French brilliance of thought, with British persistence. They have in turn addressed themselves to the problems of America's rapidly developing, greatly urbanized, tremendously industralized civilization. In the field of social engineering, freed from the encrusted class barriers and environmental obstacles that persist in Europe, they are at work upon the fabric of a new community life. They have recognized youth as the recruiting place for democracy. public education as its training camp. More recently, they have evolved the playground, the use of the public schools as social center, finally the combined playground-school-socialcenter. Here the child, millionaire's son or orphanage inmate, stands with his fellows upon common ground. Nowhere are caste lines more thoroughly obliterated.

The playground evolved by these melting-pot men stands for even more than caste destruction. It stands for the preciousness of each young life-mot as a cog in a machine, but as a bit of a universe in itself, and it stands for a fraternal relationship of that life to all others—for freedom linked with considerateness for organized liberty. It stands for playing the game squarely. On the playground, the game is won straight and not by doubling back upon itself. That "scrap of paper" exclamation could hardly have come from the brain of one trained to group action on diamond or gridiron. A blasted Belgium could hardly have come from a boys' gang which had woo its way from bullysim to club leadership. The contempt for human values in the mother love of a mountain woman had in prophecy the treatment of a whole lowland folk.

With all its faults, Germany's splendid team work has amazed all the world. Nationally powerful, it needs only the straight-dealing, castel-eveling principle which lies at the bottom of human fellowship, to make it pregnant with wonderful possibilities for pomorrow's progress. This is what the American playground offers in compact, usable, organized form for the consideration of those liberals to whom America hopes post-bellum Germany will entrust the education of her Gretchens and her vou der Haidee.

## The Housing of War Workers

Lessons from British Experience for the Fulfilment of an Urgent Task

By Bruno Lasker

OF THE SURVEY STAFF

HE VIEW of housing reform as primarily a matter of minimum standards and administrative measures, of thickness of walls and building regulations, and the absence of an intelligent public opinion on constructive housing reform as a means of assuring for the whole population an adequate supply of satisfactory dwellings, have unfortunately long been characteristic of this country. The assumption is yet made by many, with too little inquiry into the underlying economic facts, that the workman with a comparatively comfortable income, the skilled mechanic, is best housed by the normal operation of demand and supply, and that in his case individual

home purchase is the only satisfactory method of financing that operation.

The fact here as in the industrial countries of Europe (ascertained by the writer a few months before the war in Great Britain, Holland, Belgium, Germany and Sweden) is that the construction of all classes of workmen's houses, owing to general economic causes, had even in peace times fallen being the demand nearly everywhere. The kind of investment which in times past went into enterprise of this kind has been largely diverted into other, more attractive channels. Since the outbreak of the war, of course, the situation has become much worse, but the conditions which here as in Europe retard

From "Houses for Workers," Technical Journals, Ltd., Landon

ONE OF THE BEST GOVERNMENT VILLAGES FOR MUNITION WORKERS

Note the economy of street plan, providing wide thoroughfures where needed, but giving the majority of houses only inch access as they actually require; note amount of garden space given to each house, and the grouping which does away with long, monotonous frontages and gives each house a pleasant outlook. Here the British Government is not only manufacturer and builder, but city planner as well.

building enterprise only aggravate those which have existed previously.

The concentration of working populations in munition industry centers merely accentuates a greater mobility of labor which everywhere makes house investment more precarious than it used to be. The present industrial boom, with its danger of a time of deep depression to follow, only foreshadows on a larger scale one of the fluctuations of industrial enterprise which have become so frequent and so severe in recent decades, at one time leading to extreme optimism, at another making real estate of the kind here considered a drag owing to the vast amount of unemployment. The increasing difficulty of the small speculative builder-and it is he who in the past has supplied the millions with homes, not the large contractor-to secure land and material at reasonable prices at times of general activity, just now the general complaint, was sufficiently evident in peace times. Most important of all, investment in house property, whether for occupation or for renting, has lost its attraction to large groups of persons who in the past were the principal holders of such property. It may be that here and there, owing to special circumstances or inducements, the number of home-owning workingmen has increased; the general experience is that they regard freedom of movement as more precious than ever before and are less inclined to limit that freedom by the ownership of realty to a particular locality.

Other small investors who, in the past, have looked with special favor upon savings stored in house property which was tangible and seemed more or less "safe," have to no small extent lost that sense of security; partly, perhaps, because with the greater activity of health and housing commissions the life of the average small house has been reduced, but more because changes in the physical and social aspect of a neighborhood have become more rapid. Moreover, at boom times, while it is more difficult to secure mortgages at a low rate of interest, the attraction of comparatively safe industrial investments to the small saver, on the other hand, becomes greater: he realizes that without greatly endangering his safety he can get better returns and at the same time get rid of continual

personal responsibility and anxiety in the matter of repairs and rent defaulters. For those who shun all risks, the war loans have provided a new field of profitable investment not previously in existence which, to some extent, must also have come into competition with the financial demands of housing enterprise.

Thus, it is not alone to the poverty of the low paid worker who cannot afford to rent the cheapets sanitary house which it is possible to build that the shortage of houses is due. Nor is this shortage limited to large cities or to this country. It is a common experience of industrial countries and only aggravated but not caused by the war. This should be kept in mind in the discussion of possible remedies. For, although obviously the immediate need is for the provision in one way or another, but without fall, of adequate accommodation for those engaged upon war industries, that task cannot be met adequately unless it is understood in its proper setting.

The Committee on Housing of the Council of National Defense, in its recommendations (see the Suavry for November 17, 1917), nervously limits its proposals for government action to the war emergency problem and deliberately goes on record as opposed to any general measures for federal support, in any form, in aid of housing for workers not directly engaged upon government war work. "To us," says Charles Harris Whitaker (Journal of the American Institute of Architects, December, 1917) "this strict line of demarcation is only another evidence of lack of imagination, Who can say where production of war munitions is being sacrificed by a house shortage? It may be at the mine or the ore-bed, or at any one of ten thousand points where the little streams rise to fill the river of industry. It is scale that we lack. It is imagination of which we are lamentably short."

The facts pouring in from the yarious munitions and shipbuilding centers leave no doubt that the ordinary processes of commercial building do not now satisfy the demand for house room even on the part of those well able to pay for what they get. There is every sign, further, that, the present unprecedented movements of population quite apart, speculative building enterprise here as in Europe has for some time fallen behind the needs of many different classes, not only the very poor. We shall not attempt in this article to give an account of the actual shortage of houses. No general figures are available, and only crude estimates have come, so far, from individual localities. A few typical illustrations must suffice.

"Getting good labor," a special advisory war shipping committee of the New York Merchant's Association found, "is a problem aggravated by the lack of housing and transit facilities. One shipbuildrem who wants two thousand workmen says he could easily get her amounts of capital into plant colargements that they are prevented from Investing in houses, and private builders will not construct houses because of high cost of materials. . . . Several of the new shippards here are being constructed in undeveloped sections where statements of the property of the control of the c

The Fore River plant in Quincy, Mans, has increased its personnel from \$,500 to 1,000 and by the middle of February expect to employ some 2,000 more. An additional plant to be built by this complete to the plant of the Aberhaw Construction Company has greatly increased its personnel, and there are now many more employes than the community can house, in spite of every effort of the Board of Trade and real estate brokers to cope with the situation. Here also, the high cost of building materials is given as the principal factor in delaying

house construction, and federal aid has been applied for.

From Newark, N. J., likewise, comes the news that the shipbuilding companies in contracting to build ships for the government did not allow for expenditures to house thousands of men. One corporat now employing 2,000 men, with daily additions, expects shortly to have 15,000 men at work. Another, with a wooden ship building contract, has about 500 men at work and when in full operation will have 2,000; while a third plant for its full operation will require 5,000 men in addition to 1,000 now at work. The Newark Board of Trade is looking forward to a need, in the immediate future, for mmodation to house 25,000 more workers, many of them with families, and this at a time when most of the industries of that city are working full steam and require their own quota of new employes and houses. Here also contractors cannot obtain building materials at a figure which they consider reasonable, nor can they secure sufficient funds for investment in so speculative an undertaking as the housing of war contract workers. The shippards, for the most part, are situated away from existing developed areas, and transportation facilities are lacking which might help to distribute the additional population over adjacent townships. The problem in Newark is complicated by the large Negro element in the new army of workers, many of them recently immigrated from the South, unused to the climate and to northern standards of home life.

In Pennsylvania, especially all along the Delaware river, the housing horizage already has become acute. In spite of better transportation facilities which enable a considerable proportion of the workers in new and extended plants to crowd into Philadelphia, Chester and Wilmington, the immediate surroundings of the new arc contract works and shipbuilding plants are severely overcowded. The taking of lodgers is even impressed as a patiotic beyond the needs of their own members. During the last few weeks, complaints have become numerous that war contract work is actually bely up for lack of workers, and that this lack is due to inability to house them. In Pennsylvania, as in Connecticut and probably claswere, the labor turnover in war plants and shippards is proving great, in spite of relatively high wages, that special steps have been entired to be a supersylvania of the supersylvania and the long and tedious journeys to and from work involved for many employes are given as prominent causes of disastirafaction.

The war-time problem may, then, briefly be summarized as follows:

Overcrowding and long, tedious journeys to and from work menace the health of employes in war contract works and shipyards, as well as in many other plants indirectly contributing to the military preparations and operations of the country. They also threaten the efficiency of labor and make for dissatisfaction and a large labor turnover which is costly and binders output.

The original populations in centers which are undergoing, a marked industrial expansion are threatened in the same way. Lodgers are taken where there is no room and where home conditions are unsuitable for such a purpose. The normal housing needs of the people are unprovided for. All social

resources of the community, including educational and recreational facilities, are strained.

While in many cases large employers and chambers of commerce and similar bodies have taken a keen interest in this situation and are planning the erection of suitable houses, sometimes by the organization of corporations for that purpose, these plans in some cases have not matured owing to financial and other economic difficulties and, in nearly all, are absolutely insufficient in scale.

State and municipal authorities feel and are, for the greater part, powerless in face of this new danger to the public health and wellbeing. Apart from providing certain administrative facilities, they are unable to aid the industries concerned in providing for the homeless; nor do their legal and financial powers enable them to take in hand directly the housing of any considerable number of workers. Even if they had such powers, they have no experience and no influence on the conditions which make the financing of emergency housing schemes a risky investment.

The war emergency, obviously, is national in origin and character. The risk of loss connected with the erection of houses which may no longer be needed when the war is ended, therefore, should obviously fall upon the national government. The War Department, while blamed by some for not taking into consideration the relative amplitude of housing accommodation in the distribution of contracts, as a matter of fact had little choice since the shortage-considering the numbers of workers involved-owing to the general slump in house-building was bound to occur wherever large contracts were placed. But undoubtedly the federal government has a moral obligation to see to it that the hundreds of thousands, eventually probably millions, engaged upon industrial processes vital to the successful prosecution of the war, are not crippled in health, exploited by profiteering landlords, or injured in their home standards.

The problem at present experienced in the United States does not materially differ from that which earlier in the war presented itself to the other belligerents. What Germany has done to ensure good living conditions for the personnel of her war industries has not so far become known; but we may be sure that the great skill and ingenuity of her municipal and housing experts has been called into service. In France, the war-time housing problem has led to some interesting experiments, a typical example of which will be described in a forthcoming issue of the SURVEY. Our chief model of a remarkable constructive program and its development, however, comes from Great Britain. It is here that conditions at the outbreak of the war and the task confronting a nation have been most similar to our own; and for this reason we may learn from it most that will be of use in the present emergency.

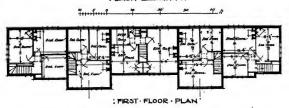

The whole setting of the British war housing program has been described so vividly and accurately in an article which has just appeared that I can recommend it to the reader instead of attempting to duplicate the effort. I am referring to a supplement to the December issue of the Journal of the American Institute of Architects, by Frederick Ls. Ackerman, or. citied What Is a House? (The Octagon, Washington, D. C., price 30 cts.); being part IV of a series of articles commenced in the September issue of that magazine. This author, after visiting in October a score of British munitions plants and the housing estates built up in their vicinity, has come to the conclusion that the pre-war situation as regards public provision for housing in England, public interests and actual achievement, but most of all the body of legislation and the administrative machinery in operation, were so different and the continuity of the co

Government Housing Scheme, Well Hall, Eltham, Kent. Similar permanent shells are also provided for the temporary housing of unmarried workers, to be converted into a terrace of several one-family houses after the war.

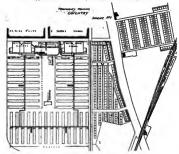

PRONY ELINATION, GERNA INSTITUTE FOR WAR WORKERS
"This building, logether with the Public Hall at Gretna, serves at he axis around which the social activities of the community revolve. The central hall with its stoge is constantly in use for entertainments of various sorts and for dencing. The floor in general serves as a club for the men, while the second floor is a club of or women. This building represents a new idea introduced into the social life of British industrial communities, and its effect upon the employes is watched with a great dead of interest throughout Great Britain."

ent from the situation here that similar results could not be anticipated from a mere copying of the emergency measures adopted since August, 1914. He says: "When the war broke, and as soon as the urgency of housing facilities was made manifest to the British authorities, they quite naturally turned for assistance directly to the existing mediums, for during the days of peace, under the powers and authorities already set up, these mediums had been more or less canable of meeting the needs of

normal conditions."

NAY-OUT OF TEMPORARY HOSTELS AT COVENTRY
Plan typical of the cartifur development of hostels. Each
of the unit contains approximately eighty individual
rooms. They or connected by passages and share the
dining-rooms and hitchens opposite the works and the
central recreation rooms. This arrangement has been
improved upon in more recent plans which provide selfcontained units with kitchens, mest rooms, etc., and with
three wings, one for each shift of workers who are thus
a surved undividuabed rest.

Curiously enough, the first housing law passed after the outbreak of the war had for its purpose a social aim which was only indirectly related to the impending shortage of houses for war workers, which few people at that time foresaw in anything like its subsequent magnitude. The government, as a result of the recommendations made by Mr. Lloyd George's Land Enquiry Committee, was at that time engaged upon the preparation of a bill greatly increasing the proportion of capital which might be lent from the Treasury in the furtherance of housing schemes, whether conducted by municipalities or by so-called public utility housing societies (organizations limited by law in the rate of dividend which they are permitted to distribute and subject to special state control), and extending the period of repayment. was hastened through Parliament for the purpose of preventing a slump in the building industry which threatened to throw out of work large numbers of men engaged in it. It carried an appropriation of £4,000,000.

As regards the general shortage of houses, it was thought that the large number of men serving with the colors would reduce the demand for new houses. But, according to Henry R. Aldridge (After-War Problems, reviewed in the Sunvey for December 1, 1917), "those who made this forecast failed to take into account the determination of soldiers' wives to keep their homes intact and ready for their husbands' return at the close of the war." Speculative building activity ceased almost entirely, and the general shortage became so intense as to lead to a rise in rents and to dissatisfaction which the recent Commission of Inquiry into Industrial Unrest found among the most widespread causes of unrest. Another factor of importance was the general rise in the rate of interest which led to the withdrawal of many mortgages, with consequent embarrassment and serious loss for small home-owners.

So far as the new industries were concerned, the effort at first was designedly temporary and improvised. Very quickly large suburbs of closely packed temporary wooden structures appeared; some of them planned to house families, others of the hostel type to provide accommodation for unmarried men and for girls. But even these temporary colonies were

From "Houses for Workers," Technical Journals, Ltd., London

Government Housing Scheme, Well Hall, Eltham, Kent. These are permanent houses, laid out by an attractive city plan, which mark a great departure from the barracks which of old provided a roof for the emergency worker, and the dreary "company houses" of American industrial subscience.

planned with skill and foresight. The spacing of the houses, though not generous, was sufficient to allow an unimpeded access of air and light. Streets were laid out economically, but with due regard to traffic needs and convenience. In their way, the bungalows and hostels built around the plants represented an advance over similar barrack structures provided in past emergencies. From the beginning, the comfort and social needs of the dwellers were given due consideration. Dining and recreation rooms, together with kitchens and the quarters of women superintendents, were provided in separate blocks; and much effort was made, especially in the case of girl workers, to render life in these hostels as homelike and natural as possible. (For a fuller account of this phase,

see an article by Theodora Roscoe, How Girls Live in a Munition Hut Town, in the English edition of the World's Work for August, 1917.)

In three years of hustling activity and thrilling human experiences in these new towns, the type of accommodation and the method of bringing it into being has enormously improved. First, as regards actual construction, it was found that the large domintories with central dining and recreation rooms had no compensating advantage in the matter of economy over the socially much more desirable division of the groups of hostels into smaller, self-contained units, each with its own dining and social facilities and with a more intimate relationship between the workers and those in control.

From "Houses for Workers," Technical Journals Ltd., London

TEMPORARY COTTAGES (HUTMENTS) FOR MUNITION WORKERS, ELTHAM, KENT Cheap, but sanitary and comfortable while they last. A type of building now discarded for permanent cottages

Next, it was found that the wooden structures cost nearly as much as permanent houses, and that it was possible to build the latter in a form more secure against the risk of non-use after the end of the war by planning them in such a way as to render easy their later conversion into cottages for family occupation. In this way, a new type was evolved, the "cottage shell," enclosing in its permanent outer structure (usually of brick, sometimes of concrete blocks) a complete hostel unit, but so arranged that the shell can at a comparatively small cost be converted into a group of four, five, or six one-family houses, each with separate access and containing at least one large living room, kitchen and three bedrooms.

As regards single houses, the widespread endeavor among English architects in recent years to produce at a minimal cost a house containing all the necessary elements for a wholesome and comfortable family life, the many experiments in such building conducted up and down the country, and the keen public and official appreciation for these efforts, provided a total of experience which soon bore full fruit when applied to the new task. There was no need to revert either to rule of thumb or to academic theories in building up the war cities. The most striking fact about them-which we can here only illustrate very inadequately-is the absence of all monotony in design, the imaginativeness and skill in the use of materials and of the natural conditions on and around the various housing estates, the close and sympathetic adaptation of cottage plans to real household needs. To many observers, the severity of architectural treatment imposed by the need for economy has given to these towns and suburbs an even greater charm and character than those possessed by the prewar garden villages and suburbs which till then had been the world's models of successful housing for families of small-

More important, however, than the advance in ideas of construction and planning since the first few months of the war has been the development of ideas on the economic aspects of the project. It is in this respect that we have most to learn from the British experience. For, the very methods now advocated by many of those who urge federal participation in the supply of houses for war workers have been given up in England as ineffective—or, at least, have had to be supplemented by others,—and this in spite of the fact that these methods had behind them a long history of successful operation and were more completely a normal governmental function than they could rapidly become here.

Even the liberal provisions made for loans by the treasury in November, 1914—the details of which are unimportant—proved wholly insufficient to bring about the desired results. The initiation of large scale housing schemes by municipal bodies proved slow and hedged in by many restrictions and conventions, many of them created by Parliament itself in prewar days to hinder so far as possible the investment of public funds in wild-cat housing schemes. It is true, a number of excellent examples of modern housing have been created by these means in the course of the war, and only a week ago we read in the papers that the always progressive city of Bradford is preparing plans for the creation of six model garden suburbs on the lills surrounding the city. But the very desire to create something of outstanding merit as compared with the older industrial areas of these cities slowed down the process.

The experience with the public utility housing societies was no better. These are mostly of the copartnership type, financed partly by instalment payments of tenant shareholders and partly by outside capital, the shareholders being renters of the llouses they occupy while they acquire an interest in the

concern as a whole and, in the capacity of investors, participate in the general increment earned by the community. The garden villages created by these societies previous to the war embody the best architectural and landscape gardening features applied to working-class housing to be found anywhere. They vary in size from estates with a score of houses to those providing for an eventual thousand or more. The economic and social advantages of this cooperative form of housing enterprise are well summarized by Robert Anderson Pope in an article in the New Republic for November 24. The experience during the war has been, however, that in spite of large government loans at a low rate of interest, the indispensable margin of capital could not, in many cases, be obtained.

The difficulty of finding investors who would be satisfied with a return of at most 5 per cent was considerable even before the war and hindered the progress of many projects. Sometimes local employers were willing to advance the necessary funds from obvious motives of self-interest, but the danger that the control of the undertaking might thus slip into their hands was keenly appreciated by those who desired to see it placed from the outset upon a basis of absolute democracy; and this form of capitalization did not, therefore, find popular favor.

To cut a long story short, not to mention the various stages by which the British government tried to advance the building of houses by making conditions more and more liberal, by undertaking, in some cases, the complete financial responsibility of new enterprises and, in others, by advancing funds to private employers for the construction of houses for their own employes, the conclusion was reached eventually and is now most widely held, that the housing of war workers on the necessary scale can only be accomplished by direct government action. "The opinion was practically unanimous," says Mr. Ackerman, "in favor of state initiative, state construction and state operation."

The task is now generally conceived in England to have outgrown the possibilities of local initiative, to have become part and parcel of the national effort to win the war by a close coordination of all the elements which make for a maximum output of war material. The government, in the building of its huge munition plants, some of them covering square miles of ground, had shown its ability to cope with constructive projects of any magnitude, cutting through red tape, where necessary, always superimposing the supreme interests of the state over the conflicting interests of private corporations and local public bodies, and using the whole of its machinery in the single endeavor to equip the industries which feed the army with everything needed to guarantee a continuous supply of labor and everything to maintain that labor in the maximum of efficiency.

This approach to the constructive housing problem, in England, is decidedly a new one. Sanitary and philanthropic reasons, in the past, were the principal sources of dynamic behind the lousing movement. Considerations of efficiency only here and there stimulated an exceptionally progressive employer of labor to provide for his workers healthful and comfortable homes and surroundings. The most important lesson of this British war housing experience for housing reformers the world over is that the demands of efficiency, conomy, public health, philanthropy, art and healthy family and community life, when rightly understood, are not contradictory but lead to identical results.
